Glossary

115 kV:	115 kilovolts or 115,000 volts
1987 Manual:	USACE Wetland Delineation Manual, January 1987
69 kV:	69 kilovolts or 69,000 volts
A1/B2 ACR:	A1/B2 Asset Condition Refurbishment Project (“the Project”)
ACI:	American Concrete Institute
ACHP:	Advisory Council on Historic Preservation
ACSS:	Aluminum-conductor steel-supported
ANSI:	American National Standards Institute
AP:	Adaptation Pathways (<i>climate change</i>)
APE:	Area of Potential Effects (<i>cultural resources</i>)
ASCE:	American Society of Civil Engineers
BAY-DE:	Bayonet Deadend
Bank:	Inland Bank, as defined by the Massachusetts Wetlands Protection Act
BLSF:	Bordering Land Subject to Flooding, as defined by the Massachusetts Wetlands Protection Act
BMPs:	Best Management Practices
BSC:	BSC Group, Inc.
BIL:	Basic Insulation Level
Bundle (conductor):	Two or more wires joined together to operate as a single phase.
BVW:	Bordering Vegetated Wetlands
Cable:	A fully insulated conductor is usually installed underground but, in some circumstances, can be installed overhead.
CBO:	Community-based organization (<i>Environmental Justice</i>)
cf:	Cubic Feet
Circuit:	A system of conductors (three conductors or three bundles of conductors) through which an electric current is intended to flow, and which may be supported above ground by transmission structures or placed underground.
CMP:	Conservation Management Permit
CMR:	Commonwealth of Massachusetts Regulations
Commonwealth	The Commonwealth of Massachusetts
Conductor:	A metallic wire busbar, rod, tube or cable that serves as a path for electric current to flow.
Contingency:	An event, usually involving the loss of one or more elements, which affects the power system at least momentarily.
CVP:	Certified Vernal Pool
CWA:	Clean Water Act
cy:	Cubic yard
Demand:	The total amount of electric power required at any given time by an electric supplier’s customers.
DGA:	Designated Geographic Area, as defined by 301 CMR 11.02
DPU:	Department of Public Utilities
DCR:	Department of Conservation and Recreation
DFW:	Massachusetts Division of Fisheries and Wildlife
EEA:	Energy and Environmental Affairs

EFI:	Environmental Field Issue Guidelines: set of guidelines developed for all construction and maintenance projects
EFSB:	Energy Facilities Siting Board
EIR:	Environmental Impact Report, per MEPA regulations
EJ:	Environmental Justice
EF:	Electric Field. A field produced as a result of voltages applied to electrical conductors and equipment; usually measured in units kilovolts per meter.
Electric Transmission:	The facilities (≥ 69 kV) that transmit electrical energy from generating plants to substations.
EG-303NE:	National Grid Environmental Guidance Document
ENF:	Environmental Notification Form, per MEPA regulations
Environmental Monitor:	Inspects environmental conditions within the construction site, reviews the contractors' compliance with environmental permit conditions during the construction phase of a project, and makes recommendations for corrective actions to protect sensitive environmental resources proximate to a construction site.
EOEEA:	Massachusetts Executive office of Energy and Environmental Affairs
EPA:	United States Environmental Protection Agency
FEMA:	Federal Emergency Management Agency
GIS:	Geographic Information System
GHG:	Greenhouse Gas
Ground Wire:	Cable/wire used to connect wires and metallic structure parts to the earth. Sometimes used to describe the lightning shield wire.
Guy Wire:	A tensioned cable designed to add stability to utility poles; extends from a pole to a ground anchor.
H-frame Structure:	A wood or steel transmission line structure constructed of two upright poles with a horizontal cross-arm and diagonal bracings.
IEEE:	Institute of Electrical and Electronic Engineers
ILSF:	Isolated Land Subject to Flooding, as defined by the Massachusetts Wetlands Protection Act
ISO-NE:	Independent Service Operator - New England, Inc. The independent system operator of New England.
IVM:	Integrated Vegetation Management
kcm:	Thousand circular mils
kV:	Kilovolt. 1 kV equals 1,000 volts.
lf:	Linear Feet
Lines	A1/B2 Transmission Lines
LOD	Limit of Disturbance
Load:	Amount of power delivered upon demand at any point or points in the electric system. Load is created by the power demands of customers' equipment (residential, commercial, and industrial).
LUW:	Land Under Waterbodies and Waterways, as defined by the Massachusetts Wetlands Protection Act
MA:	Massachusetts
MACRIS:	Massachusetts Cultural Resources Information System (<i>cultural resources</i>)
MassDEP:	Massachusetts Department of Environmental Protection

MassDEP Handbook:	MassDEP’s Handbook on Delineating Bordering Vegetated Wetlands, March 1995
MassDOT:	Massachusetts Department of Transportation
MADPH EJ Tool:	Massachusetts Department of Health Environmental Justice Tool
MassGIS:	Massachusetts Geographical Information System
MBTA:	Massachusetts Bay Transportation Authority
MC-FRM:	Massachusetts Coast Flood Risk Model
MEPA:	Massachusetts Environmental Policy Act 301 CMR 11.00, as administered through EEA
MESA:	Massachusetts Endangered Species Act, as administered by NHESP
MHC:	Massachusetts Historical Commission
Monopole:	A single pole supporting overhead utility wire.
MVP:	Municipal Vulnerability Preparedness
NEP:	New England Power Company
NERC:	North American Electric Reliability Corporation
NESC:	National Electrical Safety Code
NH:	New Hampshire
NHESP:	Natural Heritage and Endangered Species Program
NHPA:	National Historic Preservation Act
NOAA:	National Oceanic and Atmospheric Administration
NPDES:	National Pollutant Discharge Elimination System
NRHP:	National Register of Historic Places
NWI:	National Wetlands Inventory
OH Line:	Overhead Line
OHWM:	Ordinary High-Water Mark
OOB:	Order of Conditions
OPGW:	Optical Primary Ground Wire
Order:	Governor Baker’s Executive Order 569 (Order) set forth specific objectives to build resilience and adapt to the impacts of climate change in the Commonwealth.
ORWs:	Outstanding Resource Waters. Designated in 314 CMR 4.00 as high-quality waters with socioeconomic, recreational, ecological and/or aesthetic values. Includes Class A Public Water Supplies and their tributaries, CVPs.
PCN:	Pre-Construction Notification
PEM:	Palustrine Emergent Wetlands, Persistent – wet meadows, marshes
PFO:	Palustrine Forested, Broad-leaved Deciduous/Needle-leaved Evergreen – forested wetlands
PSS:	Palustrine Scrub-Shrub Broad Leaved Deciduous Wetlands – woody deciduous wetlands
PUB1Fb:	Palustrine Unconsolidated Bottom Semi-Permanently Flooded Beaver
PVP:	Potential Vernal Pool
RA	Riverfront Area, as defined by the Massachusetts Wetlands Protection Act
RC:	Regional Coordination
Reconductor:	Replacement of existing conductors with new conductors, and any necessary structure reinforcements or replacements.
Reliability:	A system’s ability to provide power during emergencies (also known as “contingencies”).
Reinforcement:	Any of a number of approaches to improve the capacity of the transmission system, including rebuilding, reconductoring, uprating, conversion and conductor bundling methods.
	Resilient Massachusetts Action Team Climate Resilience Design Tool
RMAT Tool:	

ROW:	Right-of-way. Corridor of land within which a utility company holds legal rights necessary to build operate and maintain power lines.
sf:	square feet
Shield Wire:	Wire strung at the top of transmission lines intended to prevent lightning from striking transmission circuit conductors. Sometimes referred to as static wire or aerial ground wire. May contain glass fibers for communication use. See also “OPGW”.
SHPO:	State Historic Preservation Officer (cultural resources)
SHMCAP:	State Hazard Mitigation and Climate Adaptation Plan
SS:	Site Suitability
Steel Pole: Structure:	Transmission line structure consisting of tubular steel pole(s) with arms or other components to support insulators and conductors.
Substation:	A fenced-in yard containing switches, power transformers, line terminal structures, and other equipment enclosures and structures. Voltage change, adjustments of voltage, monitoring of circuits and other service functions take place in this installation.
SWCA:	SWCA Environmental Consultant
SWPPP:	Stormwater Pollution Prevention Plan
Terminal Structure:	Structure typically within a substation that ends a section of transmission line.
Transmission Line:	An electric power line operating at 69,000 or more volts.
USACE:	United States Army Corps of Engineers
USFWS:	United States Fish and Wildlife Service
USGS:	United States Geological Survey
VHB:	Vanessa Hangen Brustlin, Inc
VMP:	Five Year Vegetation Management Plan (2019-2023), as approved by the Massachusetts Department of Agriculture.
Voltage:	A measure of the electrical pressure that transmits electricity. Usually given as the line-to-line root-mean square magnitude for three-phase systems.
Voltage Collapse:	A condition where voltage drops to unacceptable levels and cascading interruptions of transmission system elements occur resulting in widespread blackouts.
VT:	Vermont
Watercourse:	Rivers, streams, brooks, waterways, lakes, ponds, marshes, swamps, bogs, and all other bodies of water, natural or artificial, public or private.
Wetland:	Land, including submerged land, which consists of any of the soil types designated as poorly drained, very poorly drained, alluvial or flood plain by the U.S. Department of Agriculture, Natural Resources Conservation Service. Wetlands include federally jurisdictional wetlands of the U.S. and navigable waters, freshwater wetlands or coastal resources regulated by a state or local regulatory authority. Jurisdictional wetlands are classified based on a combination of soil type, wetland plants, and hydrologic regime, or state-defined wetland types.
Wire:	See Conductor
WMA:	Wildlife Management Area
WPA	Wetlands Protection Act: G.L. c. 131, §40 and implementing regulations (310 CMR 10.00)
WQC:	Water Quality Certificate
(permit/consultation requirement table)

Boston, MA 02114

RE: **A1/B2 Asset Condition Refurbishment Project
Expanded Environmental Notification Form**

Dear Secretary Card,

On behalf of the New England Power Company (NEP), BSC Group, Inc. is pleased to submit this Expanded Environmental Notification Form (EENF) for various refurbishment activities and system improvements for 733 structures and the installation of six (6) new structures along approximately 54 circuit miles along the A1/B2 Lines which extend from Warwick, Royalston, Winchendon, Gardner, Westminster, Fitchburg, Leominster, Athol, and Sterling to Pratts Junction Substation in Sterling, Massachusetts (the "Project"). The proposed Project includes required maintenance and system improvements to mitigate potential risks of electrical failure and to provide reliable delivery of electrical service.

The Project site is an active utility Right-of-Way (ROW) and contains existing utility structures, historically used access routes, and managed vegetation areas along the A1/B2 main line and three (3) tap lines, the Athol Taps 1 and 2, Gardner Tap (Crystal Lake Tap) and the East Westminster Tap. The Project is consistent with existing facilities and activities. Project impacts are construction related and include permanent land alteration due to tree removal on the ROW, access road establishment and improvements, and installation of concrete caisson foundations as well as temporary impacts related to construction matting for access, work envelopes and pull pads. Permanent fill within Bordering Vegetated Wetlands and the FEMA 100-yr Floodplain is anticipated. The Project has been designed to avoid adverse impacts to the greatest extent practicable.

NEP is submitting this EENF because the Project requires several state agency actions and exceeds four (4) MEPA thresholds for an Environmental Impact Report (EIR) and several ENF thresholds. NEP respectfully requests that MEPA allow a Single EIR filing in accordance with 301 CMR 11.06(8).

The Project will improve transmission system infrastructure and comply with comprehensive regional plans for improving electric transmission reliability in New England. Benefits of the Project include the following:

- Increased resiliency of the overall transmission line due to improved foundations and more robust structures that are better suited to withstand strong winds and storm events.

- The new overhead lines will be thicker, which will allow more electricity to flow during times of high usage, such as extreme heat events, which are anticipated to increase in frequency due to climate change.
- The installation of Optical Primary Ground Wire (OPGW) will allow better communication between substations, resulting in improved response time during storm-related emergencies and outages, which will increase public safety.
- Reduce overall disturbance to adjacent landowners, wetland resource areas, and rare species habitat over time by planning for the future and reducing the likelihood of multiple repeat projects, thereby reducing environmental impacts, and reducing costs to NEP's customers.
- The replacement of the Lines will have the added benefit of allowing more renewable energy resources to connect into the system. Addressing the climate change crisis requires a major expansion of renewable energy and the infrastructure necessary to support and deliver that energy. NEP is actively taking steps to ensure that its system is ready to meet this critical challenge. Replacing infrastructure like the A1/B2 Lines helps to accomplish this goal. The replacement lines will have higher kilovolt ratings that will support higher volumes of currently active and forecasted renewable energy resources in this region. This longer-term view is supported by the recently shared initial results of the ISO-NE 2050 study, where an upgrade to 115 kV would be necessary based on the current study assumptions and long-term forecasts for the Commonwealth.

Please publish the Notice of Availability for this ENF in the September 16th Environmental Monitor to initiate the 30-day public review and comment period. Electronic copies have been distributed to public agencies and town officials in accordance with 301 CMR 11.16(2) (see Appendix B MEPA EENF Circulation List). The Public Notice of Environmental Review will be published in local newspapers on September 16, 2022 in accordance with 301 CMR 11.15(1).

Please do not hesitate to contact me at (617) 896-4519 or hgraf@bscgroup.com with any questions or comments.

Sincerely,

BSC Group, Inc.

Heidi Graf
Associate Project Manager

Does this project meet or exceed a mandatory EIR threshold (see 301 CMR 11.03)?

Yes No

If this is an Expanded Environmental Notification Form (ENF) (see 301 CMR 11.05(7)) or a Notice of Project Change (NPC), are you requesting:

a Single EIR? (see 301 CMR 11.06(8)) Yes No

a Rollover EIR? (see 301 CMR 11.06(13)) Yes No

a Special Review Procedure? (see 301CMR 11.09) Yes No

a Waiver of mandatory EIR? (see 301 CMR 11.11) Yes No

a Phase I Waiver? (see 301 CMR 11.11) Yes No

(Note: Greenhouse Gas Emissions analysis must be included in the Expanded ENF.)

Which MEPA review threshold(s) does the project meet or exceed (see 301 CMR 11.03)?

This Project exceeds or potentially exceeds the following MEPA EIR and ENF thresholds:

MEPA EIR Threshold
EIR: Land: <i>Direct alteration of 50 or more acres of land, unless the Project is consistent with an approved conservation farm plan or forest cutting plan or other similar generally accepted agricultural or forestry practices. (301 CMR 11.03(1)(a))</i>
EIR: Wetlands, Waterways and Tidelands: <i>Alteration of one or more acres of bordering vegetated wetlands (BVW). (301 CMR 11.03(3)(a)(1)(a))</i>
EIR: Wetlands, Waterways and Tidelands: <i>Alteration of ten or more acres of any other wetlands. (301 CMR 11.03(3)(a)(1)(b))</i>
EIR: Environmental Justice: <i>The Secretary shall require an EIR for any Project that is located within a Designated Geographic Area around an Environmental Justice Population. (301 CMR 11.06(7)(b))</i>
MEPA ENF Thresholds
ENF: Wetlands, Waterways and Tidelands: <i>Alteration of 500 or more linear feet of bank along a fish run or inland bank. (301 CMR 11.03(3)(b)(1)(b))</i>
ENF: Wetlands, Waterways and Tidelands: <i>Alteration of one half or more acres of any other wetlands. (301 CMR 11.03(3)(b)(1)(f))</i>
ENF: Rare Species: <i>Taking of an endangered or threatened species or species of special concern, provided that the Project site is two or more acres and includes an area mapped as a Priority Site of Rare Species Habitats and Exemplary Natural Communities. (301 CMR 11.03(2)(b)(2)).(Potential- consultation with NHESP ongoing.)</i>

Which State Agency Permits will the project require?

The following State Agency Permit or Approvals are anticipated:

Commonwealth of Massachusetts
Executive Office of Energy and Environmental Affairs
Massachusetts Environmental Policy Act (MEPA) Office

- *Massachusetts Department of Environmental Protection (“MassDEP”) Section 401 Water Quality Certificate and Variance;*
- *Natural Heritage and Endangered Species Program (“NHESP”) Conservation Management Permit (potential);*
- *Massachusetts Department of Transportation (“MassDOT”) Permit to Access State Highway/Non-Municipal Utility Permits for Crossing Over of State Roads with Utility Lines and Permanent Access Permit;*
- *Massachusetts Energy Facilities Siting Board (“EFSB”), G.L. c. 164 §69J Petition for Approval to Construct New Transmission Lines;*
- *Massachusetts Department of Public Utilities (“DPU”), G.L. c. 164, §72 Petition for Determination of Public Necessity and Convenience; and G.L. c. 40A, §3 Petition for Zoning Exemption;*

Please refer to Project Narrative, Section 1, Table 3: Permit/Consultation Requirements

Identify any financial assistance or land transfer from an Agency of the Commonwealth, including the Agency name and the amount of funding or land area in acres:

Not applicable: no financial assistance or land transfer will be associated with this Project.

Commonwealth of Massachusetts
Executive Office of Energy and Environmental Affairs
Massachusetts Environmental Policy Act (MEPA) Office

Summary of Project Size & Environmental Impacts	<i>Existing</i>	Change	Total
LAND			
Total site acreage	~1047 +/-		
New acres of land altered		~216+/- ¹	
Acres of impervious area	41+/- ²	N/A	
Square feet of new bordering vegetated wetlands alteration		2,868,580 ³	
Square feet of new other wetland alteration ⁴		BLSF:95,593 ⁵ RA: 2,614,816 ⁶ Bank: 94,526 ⁷ LUW: 32,364 ⁸ Isolated Wetland:85,021 ⁹	
Acres of new non-water dependent use of tidelands or waterways		N/A	
STRUCTURES			
Gross square footage	N/A	N/A	N/A
Number of housing units	N/A	N/A	N/A
Maximum height (feet) ¹⁰	51	39-45	~90

1 Includes all new areas of disturbance for tree removal (164 acres) and construction of access roads (52 acres). See Sections 1.6.2, 1.6.3, 1.6.4 and Section 4 for more detail.

2 Includes paved areas and substations within Project ROW.

3 Bordering Vegetated Wetland includes approximately 1,896 sf of permanent fill due to concrete caissons; approximately 666,032 sf of wetland conversion due to tree removal; and approximately 2,200,651 sf of temporary construction matting impact during construction.

4 BLSF- Bordering Land Subject to Flooding; RA- Riverfront Area; Bank- Inland Bank. LUW- Land Under Water.

Note that impacts located within the limits of RFA overlap with impacts to BLSF, BVW and the 100-ft Buffer Zone. Therefore, the total impacts to the Project Site are not equal to the sum of the alterations.

5 BLSF includes approximately 632 sf of new concrete caissons; 81,022 sf of tree removals; and 13,939 sf of temporary construction matting. Overexcavation for work envelopes, pull pads and access, 293,924 sf not included in total as no loss in flood storage will occur.

6 RA includes approximately 3,479 sf of new concrete caissons; 1,177,862 sf for grading and retaining walls; 171,544 sf of new and/or re-establishment of access roads; 748,796 sf of tree removals; and 513,137 sf of temporary construction matting.

7 Bank includes approximately 26,572 sf of tree removals (overhead line clearance and Limit of Disturbance) and 67,954 sf of temporary construction matting. In most cases, construction mat crossing will span the Bank of rivers and stream; however, the potential for alteration has been accounted for in the review of MEPA Thresholds.

8 LUW includes approximately 158 sf of new concrete caissons on the Crystal Lake Tap Line and 32,206 sf of construction matting in open water where spanning is not feasible.

9 Isolated wetland impacts includes approximately 73,181 sf of temporary construction matting; and 11,840 sf of permanent impacts (79 sf of fill for caisson foundation and 11,761 sf of forested wetland conversion to PSS.)

10 Mainline structure heights are approximately 51-ft and tap line structures are approximately 45-ft. Replacement and new structures for the mainline and tap lines will be approximately 90-ft.

GENERAL PROJECT INFORMATION – all proponents must fill out this section

PROJECT DESCRIPTION:

Describe the existing conditions and land uses on the project site: _____

A detailed description of the existing conditions and land uses on the project site is provided in the Project Narrative (Section 1: Project Overview and Summary and Section 3: Land Use)

Describe the proposed project and its programmatic and physical elements: _

NOTE: The project description should summarize both the project’s direct and indirect impacts (including construction period impacts) in terms of their magnitude, geographic extent, duration and frequency, and reversibility, as applicable. It should also discuss the infrastructure requirements of the project and the capacity of the municipal and/or regional infrastructure to sustain these requirements into the future.

Within MA, the A1/B2 ACR Project (or “the Project”) will be located within existing electric transmission ROW containing the existing 69 kV A1 and B2 Lines, also referred to as “the mainline” and three (3) intersecting tap lines. The A1/B2 mainline extends from the Massachusetts border in Warwick through Royalston, Winchendon, Gardner, Westminster, Fitchburg, and Leominster to the Pratts Junction #255 Substation in Sterling. The tap lines consist of the existing Athol Taps 1 and 2 in Athol and Royalston, the existing Crystal Lake Tap in Gardener, and the existing East Westminster Tap in Westminster. The Project is part of a larger refurbishment effort that continues through NH and terminates at the Vernon #12 Switchyard located in Vernon, Vermont.

Please refer to the Locus Map in Appendix A: Figures for more information.

Project Need: The A1/B2 Lines were originally constructed in 1909 and the original lattice structures remain. The Lines were reconducted in the 1920s and were reinsulated in 2004. Structures and wires are in need of replacement due to asset condition and aging infrastructure. In addition, the access conditions vary considerably throughout the ROW. Existing access is present in some areas, but in others, the historic access route is in need of significant repair and does not meet NEP’s standard to safely support specialized equipment. As such, the Project’s primary objective is to complete required system improvements that will address poor asset condition, mitigate potential risks of electrical failure, and to provide long-term reliable delivery of electrical service and maintenance of the lines. As part of the proposed refurbishment, fiber optic ground wire will be used to replace the existing shield wire to provide high speed communications between substations.

Secondarily, the initial results of the Independent System Operator – New England (“ISO-NE”) 2050 Transmission Study (“Study”) support upgrading the line to 115 kV. Based on current Study assumptions and forecasts, renewable energy connections and customer needs will ultimately require the system operate at the higher voltage at some point in the future. In an effort to reduce the impacts of a second large-scale refurbishment on the environment, the community and its customers, NEP proposes to “future proof” the A1/B2 mainline and tap lines as part of this Project constructing lines with 115 kV capacity but operating the lines at 69 kV until the additional capacity is needed.

Project Description:

The Project includes various refurbishment activities and system improvements for 711 structures and the installation of six (6) new vertical jumper switch structures along the mainline and tap lines in MA. Activities will occur within an existing ROW and all efforts will be made to minimize the need for construction activities outside the easement.

Commonwealth of Massachusetts
Executive Office of Energy and Environmental Affairs
Massachusetts Environmental Policy Act (MEPA) Office

Along the A1/B2 ROW and the Athol, Crystal Lake, and East Westminster Tap Lines, the 711 proposed structure replacements will entail removing the existing structure and installing a replacement structure in an adjacent location. Based on the current Project design, it is assumed 305 of the replacement structures will be on concrete caisson foundations, due to the tension on the structure. The remaining 406 poles will be directly embedded into the ground and will not require caisson foundations.

The Project will be reconducted with 795 Aluminum-conductor steel-supported conductor (“ACSS”) and existing shield wire will be replaced with two (2) Optical Primary Ground Wires (“OPGW”). In certain situations where a replacement structure is proposed 25-ft or more from the existing structure, a temporary structure will be installed to facilitate the new structure, conductor and OPGW installation. Additionally, in approximately 30 locations, temporary structures may be required to increase the height of the conductor during construction so that construction vehicles and “live line” work (construction activities conducted while the lines are energized) can occur at a safe distance from the conductor. The temporary structures will then be removed along with the existing structures once the reconducting is complete.

The existing ROW width varies from 100 ft - 125-ft. The existing cleared ROW width also varies along the length of the transmission and tap lines. In order to obtain the required clearances under all weather conditions, the Project proposes the ROW be consistently cleared to 100-ft on the mainline and Crystal Lake Tap Line, and 125-ft on the Athol Tap Line. Some additional tree removal may be required to accommodate Project access since construction of new and/or re-establishment of access roads is proposed along the majority of the Project route.

Proposed Conditions:

The means and methods of construction to facilitate general maintenance and system improvement activities for the purpose of refurbishment work is given below. Details on each activities are provided in the Project Narrative (Section 1.6: Proposed Conditions).

- a. Structures
- b. Construction Access and Limit of Disturbance:
- c. Vegetation Management
- d. Access Routes, Work Pads and Envelopes and Pull Pads
 - o Access Road Routes
 - o Work Envelopes and Pull Pads
 - o Retaining Walls

Impacts: *The Project has been designed to avoid adverse impacts where feasible. As an active ROW, most of the Project area is already disturbed and maintained. Both potential and temporary impacts to various resource categories are summarized in Table 2: Summary of A1/B2 Transmission Lines Refurbishment Impacts in Section 1 of the Project Narrative and discussed in Sections 3 through 8.*

Project impacts include tree removal in excess of regular vegetation management; work within wetland resource areas; work within mapped rare species habitat. Most wetland impacts are temporary and are related to the use of construction matting and the temporary use of stabilizing material within work areas during construction. Permanent wetland impacts are primarily associated with the conversion of forested wetland to scrub-shrub wetland due to tree removal, which is anticipated to create a benefit to successional wildlife (please refer to Appendix F Wildlife Habitat Evaluation). New structures in BVW and BLSF will result in minimal amounts of permanent fill relative to the total extent of resource areas on the Project site. Please refer to Appendix C: National Grid Environmental Guidance Document (“EG-303NE”) for additional information on procedures and policies implemented during construction for ROW access, maintenance and construction best management practices.

MEPA: *The Project exceeds or potentially exceeds the MEPA thresholds identified on Pages ii*

Commonwealth of Massachusetts
Executive Office of Energy and Environmental Affairs
Massachusetts Environmental Policy Act (MEPA) Office

and iii this EENF.

Describe the on-site project alternatives (and alternative off-site locations, if applicable), considered by the proponent, including at least one feasible alternative that is allowed under current zoning, and the reasons(s) that they were not selected as the preferred alternative:

NOTE: *The purpose of the alternatives analysis is to consider what effect changing the parameters and/or siting of a project, or components thereof, will have on the environment, keeping in mind that the objective of the MEPA review process is to avoid or minimize damage to the environment to the greatest extent feasible. Examples of alternative projects include alternative site locations, alternative site uses, and alternative site configurations.*

Alternatives:

i. No Build Alternative

As required by 301 CMR 11.07(6)(f)(2), a No Build Alternative must be evaluated to establish a baseline against which the Project can be evaluated. However, in this instance, the No Build Alternative does not achieve the Project's goals and benefits. This Project consists of refurbishment and improvements to existing assets. If no action is taken, deteriorating structures will pose a safety risk to NEP personnel and will affect NEP's ability to provide reliable electrical service to members of the public. Given the condition of the existing circuits and the need to provide high speed communications between the substations these circuits serve, this is not a feasible alternative and was not evaluated further.

ii. 69 kV Rebuild Alternative

As stated above, future proofing the Lines for a 115 kV carrying capacity allows NEP to minimize the likelihood of repeat impacts to adjacent landowners and environmentally sensitive areas as customer and renewable energy needs continue to grow in the region. Refurbishing the Lines to operate with a 69 kV carrying capacity would not meet the identified need and therefore, was not considered a feasible alternative.

Additionally, due to the outage constraints associated with the A1/B2 Lines, the Project would need to utilize live line construction techniques. As such, the proposed replacement structures would be installed at a height above the existing structures, regardless of proposed voltage. Should the existing structures be replaced to meet 69 kV standards, this would only result in a decrease of approximately 5.5-ft in structure height from those proposed. Therefore, the minimum horizontal clearance requirements would be the same at 69 kV as they are for the proposed 115 V, and tree removal requirements on ROW would not be reduced. Refurbishing the Lines at 69 kV would not reduce environmental impacts and would not provide the benefit of operating the Lines at 115 kV in the future.

iii. Critical Asset Repair Alternative

A critical asset repair alternative was considered to address only the most critical asset related issues. However, this would require returning to the A1/B2 Lines repeatedly over time to complete less critical maintenance and improvement activities. This would result in repeated access and temporary impacts including temporary construction matting, within Public Open Space and Recreational Areas, adjacent Watershed Areas, BVW and other environmental resources and rare species habitat. Additionally, this alternative would not address the quantity of asset condition concerns, would not improve the reliability of existing communications between the substations served by the circuits, and would result in inefficiencies in revisiting the same ROW within a short time span. This alternative was deemed infeasible and not analyzed further.

iv. 115 kV Structure Design Alternatives

Double-circuit davit arm structures are proposed for the mainline and single-circuit davit arm structures are proposed for the tap lines; however, alternative structure types were evaluated. For the A1/B2 mainline, alternative structure type, davit arm length and installation method were evaluated and determined to be infeasible due to increased footprint, ice jump

Commonwealth of Massachusetts
Executive Office of Energy and Environmental Affairs
Massachusetts Environmental Policy Act (MEPA) Office

condition¹¹, soil conditions and safe clearance distance, respectively. For the tap lines, alternative structure types were evaluated and determined to be infeasible due to outage constraints, reliability concerns, and limiting risk of tree contact, respectively.

Conclusion:

As described above, alternative concepts, including a No Build Alternative, were initially considered to meet the identified needs, but ultimately rejected. The No Build Alternative was rejected because it would not address asset reliability and repair requirements. Partial refurbishment and rebuilding to 69 kV standards would require supplemental projects to adequately reinforce the A1/B2 Lines over the next decade. The proposed Project is the only alternative that meets the identified needs while minimizing overall project impacts. See Section 2 for additional detail on the described alternatives.

Summarize the mitigation measures proposed to offset the impacts of the preferred alternative:

Mitigation:

NEP follows a set of policies for ROW access, maintenance, and construction best management practices (“BMPs”). By consistently implementing these procedures, NEP ensures that transmission lines are maintained and constructed by trained personnel in a manner that minimizes potential impacts to the environment, adheres to permit conditions, and meets industry standards. Key elements of the construction policy include pre-construction field investigations, field inspections during construction, and postconstruction inspections.

Throughout construction, appropriate consideration will be given to Project implementation in a manner consistent with conditions of permits/authorizations and approved mitigation measures.

To minimize Project impacts, NEP has incorporated the following actions and considerations throughout the planning and design phases:

Several asset condition and reliability needs were combined into one project scope in an effort to reduce the need for repeat disturbances to wetlands and adjacent property owners in this shared ROW;

- Existing ROW and access roads are being used to avoid new land disturbance, where feasible;*
- Field investigations were completed to assess constructability and avoid/mitigate sensitive resources;*
- Agency consultations are in progress;*
- Replacement structures are being located outside of BVW where feasible; and*
- Temporary construction mat BMPs will be utilized to minimize wetland impacts.*

11 The maximum jump height of a transmission line after ice-shedding. Ice-shedding from conductors can cause significant vertical vibration of the transmission line.

Commonwealth of Massachusetts
Executive Office of Energy and Environmental Affairs
Massachusetts Environmental Policy Act (MEPA) Office

Additional mitigation measures will be implemented as required by state, federal and local requirements. NEP anticipates that the final mitigation package will be developed during the federal, state, and local permitting processes outlined in the next section, and that the package will fully address the required permit conditions and agency concerns. NEP anticipates that mitigation will demonstrate no net loss of existing wetland functions, values, and statutory interests within the watersheds.

If the project is proposed to be constructed in phases, please describe each phase:

Not applicable.

AREAS OF CRITICAL ENVIRONMENTAL CONCERN:

Is the project within or adjacent to an Area of Critical Environmental Concern?

Yes (Specify _____)

No

if yes, does the ACEC have an approved Resource Management Plan? ___ Yes ___ No;

If yes, describe how the project complies with this plan.

Will there be stormwater runoff or discharge to the designated ACEC? ___ Yes ___ No;

If yes, describe and assess the potential impacts of such stormwater runoff/discharge to the designated ACEC.

RARE SPECIES:

Does the project site include Estimated and/or Priority Habitat of State-Listed Rare Species? (see

http://www.mass.gov/dfwele/dfw/nhosp/regulatory_review/priority_habitat/priority_habitat_home.htm)

Yes (Specify ___ see below ___)

No

Three (3) bird, three (3) herptile, two (2) insect, and one (1) plant species are mapped along portions of the Project route Warwick, Royalston, Winchendon, Athol, Fitchburg, and Leominster.

The names and locations of these species are not provided, as requested by MA NHESP.)

See Project Narrative, Section 5: Rare Species.

HISTORICAL /ARCHAEOLOGICAL RESOURCES:

Does the project site include any structure, site or district listed in the State Register of Historic Place or the inventory of Historic and Archaeological Assets of the Commonwealth?

Yes (Specify: See below) No

NEP's cultural resource consultant, SWCA Environmental Consultants has conducted a cultural resources due diligence and sensitivity assessment and are conducting an archeological survey and historic architectural properties assessment,

Commonwealth of Massachusetts
Executive Office of Energy and Environmental Affairs
Massachusetts Environmental Policy Act (MEPA) Office

under a permit issued by the Massachusetts Historical Commission (“MHC”). See Project Narrative Section 6: Historical/Archaeological Resources.

If yes, does the project involve any demolition or destruction of any listed or inventoried historic or archaeological resources? Yes (Specify _____) No

WATER RESOURCES:

Is there an Outstanding Resource Water (ORW) on or within a half-mile radius of the project site? ___ Yes **X** No; if yes, identify the ORW and its location. _____

- *Notown Reservoir, Leominster, MA*
- *Fall Brook Reservoir, Leominster, MA*
- *Goodfellow Pond, Leominster, MA*
- *Simonds Pond, Leominster, MA*
- *Distributing Reservoir, Leominster, MA*
- *Morse Reservoir, Leominster, MA*
- *Parleys Brook Reservoir, Gardner, MA*

Approximately 40 Certified Vernal Pools (CVPs) are located within a half-mile radius of the ROW in Royalston, Winchendon, Gardner, Westminster, Fitchburg, Leominster, and Sterling. There are no CVPs mapped within the ROW.

(NOTE: Outstanding Resource Waters include Class A public water supplies, their tributaries, and bordering wetlands; active and inactive reservoirs approved by MassDEP; certain waters within Areas of Critical Environmental Concern, and certified vernal pools. Outstanding resource waters are listed in the Surface Water Quality Standards, 314 CMR 4.00.)

Are there any impaired water bodies on or within a half-mile radius of the project site?

X Yes ___ No; if yes, identify the water body and pollutant(s) causing the impairment: See Table Below.

Impaired Waterways in MA¹² (on or within 0.5-mile radius of the Project site)					
Waterbody	Watershed	Water Type Category	Category # & Classification	Pollutant Causing Impairment	TMDL Cou

Is the project within a medium or high stress basin, as established by the Massachusetts Water Resources Commission? Yes No

STORMWATER MANAGEMENT:

Generally describe the project's stormwater impacts and measures that the project will take to comply with the standards found in MassDEP's Stormwater Management Regulations:

NEP will submit a Stormwater Pollution Prevention Plan (“SWPPP”) for the Project in compliance with the EPA’s National Pollutant Discharge Elimination System (NPDES) program under the Stormwater Construction General Permit. The SWPPP establishes a construction period contact list, presents a description of the proposed work, and identifies stormwater controls, spill prevention, and inspection practices to be implemented for the management of construction-related stormwater discharges from the Project. The SWPPP clearly identifies parties responsible for monitoring and reporting any activities out of compliance with the SWPPP or other environmental permits or approvals, and for handling extraordinary situations. The SWPPP also defines monitoring to occur until all disturbed areas on the site have been stabilized using standard BMPs. In this manner, the potential impacts

12 MassGIS (Bureau of Geographic Information), December 2020, URL: <https://www.mass.gov/info-details/massgis-data-massdep-2016-integrated-list-of-waters-305b303d>

Commonwealth of Massachusetts
Executive Office of Energy and Environmental Affairs
Massachusetts Environmental Policy Act (MEPA) Office

associated with land disturbance (e.g. erosion and sedimentation) will be proactively managed so that impacts can be avoided. Please refer to Appendix C.

MASSACHUSETTS CONTINGENCY PLAN:

Has the project site been, or is it currently being, regulated under M.G.L.c.21E or the Massachusetts Contingency Plan? Yes No ; if yes, please describe the current status of the site (including Release Tracking Number (RTN), cleanup phase, and Response

Action Outcome classification): see below

RTN	Site Name	Site Address	Municipality	Compliance Status	Compliance Date
2-0012349	Pratts Junction Substation	Pratts Junction Rd	Sterling	RAO	8/9/2002

RTN 2-0012349 included as work will be conducted within the limits of the Disposal Site Boundary; however, it will not disturb the subsurface as only overhead work is proposed.

Is there an Activity and Use Limitation (AUL) on any portion of the project site? Yes No ; if yes, describe which portion of the site and how the project will be consistent with the AUL:

An AUL was identified with the Pratts Junction Substation in Sterling, MA. However, no work is proposed within the limits of the AUL, nor will there be subsurface work within the Substation.

Are you aware of any Reportable Conditions at the property that have not yet been assigned an RTN? Yes No if yes, please describe: _____

SOLID AND HAZARDOUS WASTE:

If the project will generate solid waste during demolition or construction, describe alternatives considered for re-use, recycling, and disposal of, e.g., asphalt, brick, concrete, gypsum, metal, wood: _____

The intent is for all existing wood and steel towers proposed for removal to be transported to an appropriate recycling facility. The removal and recycling will be consistent with all applicable regulations.

(NOTE: Asphalt pavement, brick, concrete and metal are banned from disposal at Massachusetts landfills and waste combustion facilities and wood is banned from disposal at Massachusetts landfills. See 310 CMR 19.017 for the complete list of banned materials.)

Will your project disturb asbestos containing materials? Yes No ; if yes, please consult state asbestos requirements at <http://mass.gov/MassDEP/air/asbhom01.htm>

Describe anti-idling and other measures to limit emissions from construction equipment:

NEP will comply with state laws regulating the use of diesel-powered equipment and vehicle idling times during construction. NEP will also take measures to limit vehicle idling times and to reduce air emissions, including the following:

Any diesel-powered non-road construction equipment with engine horsepower ratings of 50 and above to be used for 30 or more days over the course of construction will either be USEPA Tier 4-compliant or will be retrofitted with USEPA-verified (or equivalent) emission control devices such as oxidation catalysts or other comparable technologies (to the extent that they are commercially available) and installed on the exhaust system side of the diesel combustion engine.

Commonwealth of Massachusetts
Executive Office of Energy and Environmental Affairs
Massachusetts Environmental Policy Act (MEPA) Office

NEP requires the use of ultra-low sulfur diesel fuel in its diesel-powered construction equipment and limits idling time to five (5) minutes except when engine power is necessary for the delivery of materials or to operate accessories to the vehicle such as power lifts.

Vehicle idling is to be minimized during construction activities, in compliance with Massachusetts Anti-idling Law, G.L. c. 90 § 16A, c. 111 §§ 142A – 142M, and 310 CMR 7.11.

DESIGNATED WILD AND SCENIC RIVER:

Is this project site located wholly or partially within a defined river corridor of a federally designated Wild and Scenic River or a state designated Scenic River? Yes ___ No **X**;
if yes, specify name of river and designation:

The closest designated scenic river to the Project site is the Nashua River which lies approximately four (4) miles away.

The mainstem of the Nashua River from the confluence of the North and South Nashua Rivers in Lancaster, Massachusetts, extends north to the Massachusetts-New Hampshire border, excluding:

- *From 700-ft upstream of the crest of Ice House Hydroelectric Project Dam to 500-ft downstream.*
- *From 9,240-ft upstream from the crest of the Pepperell Hydroelectric Project Dam to 1,000-ft downstream.*

If yes, does the project have the potential to impact any of the “outstandingly remarkable” resources of a federally Wild and Scenic River or the stated purpose of a state designated Scenic River?

Yes ___ No ___ ; if yes, specify name of river and designation: _____;

if yes, will the project will result in any impacts to any of the designated “outstandingly remarkable” resources of the Wild and Scenic River or the stated purposes of a Scenic River.

Yes ___ No ___ ; if yes, describe the potential impacts to one or more of the “outstandingly remarkable” resources or stated purposes and mitigation measures proposed.

4. Plan, at an appropriate scale, depicting environmental constraints on or adjacent to the project site such as Priority and/or Estimated Habitat of state-listed rare species, Areas of Critical Environmental Concern, Chapter 91 jurisdictional areas, Article 97 lands, wetland resource area delineations, water supply protection areas, and historic resources and/or districts. *See Appendix A, MEPA General Purpose Plans.*
5. Plan, at an appropriate scale, of proposed conditions upon completion of project (if construction of the project is proposed to be phased, there should be a site plan showing conditions upon the completion of each phase). *See Appendix A, MEPA General Purpose Plans.*
6. List of all agencies and persons to whom the proponent circulated the ENF, in accordance with 301 CMR 11.16(2). *See Cover Letter and Attached Circulation List.*
7. List of municipal and federal permits and reviews required by the project, as applicable. *See Table 3: Permit Consultation Requirements in the Project Narrative, Section 1: Project Information.*
8. Printout of output report from RMA Climate Resilience Design Standards Tool, available [here](#). *See Appendix G.*
9. Printout from the EEA [EJ Maps Viewer](#) showing the project location relative to Environmental Justice (EJ) Populations located in whole or in part within a 1-mile and 5-mile radius of the project site. *See Appendix H.*

LAND SECTION – all proponents must fill out this section

I. Thresholds / Permits

A. Does the project meet or exceed any review thresholds related to **land** (see 301 CMR 11.03(1) Yes ___ No; if yes, specify each threshold:

Direct alteration of 50 or more acres of land, unless the Project is consistent with an approved conservation farm plan or forest cutting plan or similar. (301 CMR 11.03(1)(a)).

Approximately 216 acres of permanent impacts is proposed, which comprises of 164 acres of tree removal proposed to obtain minimum horizontal clearances with the overhead line and tree removals within the Limit of Disturbance associated with preliminarily assumed secondary impacts from grading activities, and approximately, 51 acres will result from the proposed access routes anticipated to be cleared.

II. Impacts and Permits

A. Describe, in acres, the current and proposed character of the project site, as follows:

	<u>Existing</u>	<u>Change</u>	<u>Total</u>
Footprint of buildings	___ N/A ___	___ N/A ___	___ N/A ___
Internal roadways	___ N/A ___	___ N/A ___	___ N/A ___
Parking and other paved areas	___ N/A ___	___ N/A ___	___ N/A ___
Other altered areas (see Note 1)	~844	~216	~1060
Undeveloped areas (see Note 2)	~79	~19	~79
Total: Project Site Acreage	~1047	N/A	~1047

(1) This number reflects the existing ROW, with change due to tree removal and access road establishment/re-establishment. The utility ROW has been utilized for decades, and much of the land has been previously used and/or disturbed by utility-related activities, including the installation and maintenance of existing utility structures, access roads, and vegetation management for safety clearance.

(2) The existing undeveloped areas consist of the DCR property where tree removal is required to maintain sufficient clearances. Existing trails will be improved outside of the ROW. Tree removal and construction activities will remain within NEP's easement in Article 97 Land; thus, no change in Land Use is proposed.

Please refer to Section 3: Land Use in the Project Narrative.

B. Has any part of the project site been in active agricultural use in the last five years?

Yes ___ No; if yes, how many acres of land in agricultural use (with prime state or locally important agricultural soils) will be converted to nonagricultural use?

No land in agricultural use will be converted to nonagricultural use.

- C. Is any part of the project site currently or proposed to be in active forestry use?
 Yes No; if yes, please describe current and proposed forestry activities and indicate whether any part of the site is the subject of a forest management plan approved by the Department of Conservation and Recreation:
- D. Does any part of the project involve conversion of land held for natural resources purposes in accordance with Article 97 of the Amendments to the Constitution of the Commonwealth to any purpose not in accordance with Article 97? Yes No ; if yes, describe:
- E. Is any part of the project site currently subject to a conservation restriction, preservation restriction, agricultural preservation restriction or watershed preservation restriction? Yes No; if yes, does the project involve the release or modification of such restriction? Yes No; if yes, describe:
- F. Does the project require approval of a new urban redevelopment project or a fundamental change in an existing urban redevelopment project under M.G.L.c.121A? Yes No; if yes, describe:
- G. Does the project require approval of a new urban renewal plan or a major modification of an existing urban renewal plan under M.G.L.c.121B? Yes No; if yes, describe:

III. Consistency

- A. Identify the current municipal comprehensive land use plan
Title: See below Date: See below

The current municipal comprehensive land use plans are:

- *Town of Athol – Athol Master Plan, November 2002*
- *Town of Winchendon - Community Master Plan, 2020*
- *City of Fitchburg - Vision 2020 - Fitchburg's Comprehensive Master Plan*
- *Town of Westminster Master Plan, 2014*
- *Town of Sterling Master Plan, March 2022 Final Draft*
- *Gardner Community Development Plan, 2006*

The Towns of Warwick and Royalston and the City of Leominster do not have comprehensive plans, and therefore, are not cited.

- B. Describe the project's consistency with that plan with regard to:
- 1) economic development See below
 - 2) adequacy of infrastructure See below
 - 3) open space impacts See below
 - 4) compatibility with adjacent land uses See below

The Project consists of upgrades to an existing utility line which will facilitate regional system electrical reliability. Therefore, it is consistent with the local planning documents.

Town of Athol

The Town of Athol Master Plan describes the Town's plans specific to Land Use and Zoning, Community Facilities and Housing, Economic Development, Historic and Scenic Resources, Transportation, Capital Improvement and Recreation.

A review of Athol's economic goals has concluded that the Project corresponds with the implementation of this Plan. One of the major economic goals in the Master Plan is to encourage economic development in the town without any destruction of natural resources and cultural landscape. As noted previously, the purpose of this Project is to undertake necessary upgrades and improvements to the existing electrical transmission system so it may continue to provide safe, reliable electric power, and to maintain compliance with regional and national electric standards. The Project is within an existing ROW, and no new cross-country ROWs are proposed. Similarly, the Project helps strengthen the infrastructure of Athol by providing reliable sources of electric power that are vital for the well-being of this community.

The Project is proposed to be constructed on NEP-owned land or easement, and within an existing transmission line ROW, and necessary measures will be taken to ensure no damage to the natural, historical, and open space resources, therefore it is not anticipated that the Project will have any impact on Land Use, Community Facilities and Housing, Economic Development, Historic and Scenic Resources, Transportation and Recreation.

Town of Winchendon

The Town of Winchendon Master Plan describes the Town's plans specific to Land Use, Open Space, Economic Development, Housing, Historic and Cultural Resources, Transportation and Circulation, Service and facilities, Community Health and Well-being.

A review of Winchendon's land use goals has concluded that the Project corresponds with the implementation of this Plan. The town's Master Plan outlines sets of land use goals that aim at promoting greener living and preservation of natural resources and wildlife habitats and protecting environmentally sensitive areas, along with the maintenance of open space and recreation lands. Similarly, economic development goals in the Master Plan summarize the goals of the town to develop an environmentally sound economy by promoting development and redevelopment of economic infrastructures. The Project complies and corresponds with the Master Plan as the purpose of this Project is to undertake necessary upgrades and improvements to the existing electrical transmission system so it may continue to provide safe, reliable electric power and to maintain compliance with regional and national electric standards. Furthermore, the work is within the existing ROW, and no new cross-country ROWs are proposed. The Project will implement, assess, and monitor work within sensitive areas such as wetland, conservation land, etc. and best management practices will be implemented to ensure protection and preservation of the resource areas.

The Project is proposed to be constructed on NEP-owned land or easement, and within an existing transmission line ROW, and necessary measures will be taken to ensure no damage to the natural, historical, and open space resources, therefore it is not anticipated that the Project will have any impact on Land Use, Open Space, Economic Development, Housing, Historic and Cultural Resources, Transportation and Circulation, Service and facilities, Community Health and Well-being.

City of Fitchburg

The City of Fitchburg Master Plan describes plans specific to Land Use, Economic Development, Housing, Natural Cultural and Historic Resources, Transportation and Circulation, and Open Space and Recreation.

A review of Fitchburg's economic goals has concluded that the Project corresponds with the implementation of this Plan. The main city character goal reviewed in the Master Plan outlines the protection of existing land uses, historic structures, landscapes, and environmentally sensitive areas. The Project has adapted recommendations listed in the land use section of the Plan. Reasonable site plan review will be done to ensure safety, aesthetic impacts, and environmental impacts of the Project. The economic goals and objectives in the document explicitly highlight the maintenance of utility systems which will support the businesses running in the city. The Project complies and corresponds with the Master Plan as the purpose of this Project is to undertake necessary upgrades and improvements to the existing electrical transmission system so it may continue to provide safe, reliable electric power and to maintain compliance with regional and national electric standards.

The Project is proposed to be constructed on NEP-owned land or easement, and within an existing transmission line ROW, and necessary measures will be taken to ensure no damage to the natural, historical, and open space resources, therefore it is not anticipated that the Project will have any

impact on Land Use, Economic Development, Housing, Natural Cultural and Historic Resources, Transportation and Circulation, and Open Space and Recreation.

Town of Westminster

The Town of Westminster Master Plan describes the Town's plans specific to Land Use and Zoning, Economic Development, Housing, Transportation and Circulation, and Open Space and Recreation.

The Westminster Master Plan sets forth a community goal and provides an outline on the development strategies to implement which strengthen the economy and promote sustainable and environmentally sound utilization of open space and recreation.

A review of Westminster's economic goals has concluded that the Project corresponds with the implementation of this Plan. Plans developed by the Town of Westminster for their economic development encourage the upgrade and expansion of infrastructures that are necessary for new economic development, as well as capitalizing the existing open spaces and community resources. The Project complies and corresponds with the Master Plan as the purpose of this Project is to undertake necessary upgrades and improvements to the existing electrical transmission system so it may continue to provide safe, reliable electric power and to maintain compliance with regional and national electric standards.

Additionally, the Plan sets forth open space and recreational objectives and goals. To comply with the open space and recreation objectives of maintaining coordination among the Town boards and the residents, the Project will take necessary steps to notify the Conservation Commission, and the town's Planning Board. Furthermore, the Project is proposed to be constructed on NEP-owned land or easement, and within an existing transmission line ROW, and necessary measures will be taken to ensure no damage to the natural, historical, and open space resources, therefore it is not anticipated that the Project will have any impact on Land Use, Economic Development, Housing, Transportation and Circulation, and Open Space and Recreation.

Town of Sterling

The Town of Sterling Draft Master Plan describes the Town's plans specific to Land Use and Development, Economic Development, Housing, Natural, Historic, and Cultural Resources, Transportation and Circulation, and Open Space and Recreation.

A review of Sterling's land use and open space goals has concluded that the Project corresponds with the implementation of this Plan. The Town of Sterling works in concert alongside their residents, business owners, officials, and organizations to facilitate land use planning which capitalizes on the region's most important assets. The Plan developed review growth trends within the region and outline sets of strategic goals and policies aimed at promoting sound land use planning that protects the town's rural and scenic character. Utility facilities or services are not explicitly addressed.

As noted previously, the purpose of the Project is to undertake necessary upgrades and improvements to the existing electrical transmission system so it may continue to provide safe, reliable electric power and to maintain compliance with regional and national electric standards. Additionally, the Project is proposed to be constructed on NEP-owned land or easement, and within an existing transmission line ROW, and necessary measures will be taken to ensure no damage to

the natural, historical, and open space resources, therefore it is not anticipated that the Project will have any impact on Land Use, Economic Development, Housing, Natural, and Historic, and Cultural Resources, Transportation and Circulation, and Open Space and Recreation.

- C. Identify the current Regional Policy Plan of the applicable Regional Planning Agency (RPA)

RPA: Montachusett Regional Planning Commission

Title: Montachusett Regional Strategic Framework Plan Date April 2011

- D. Describe the project's consistency with that plan with regard to:

- 1) economic development See below
- 2) adequacy of infrastructure See below
- 3) open space impacts See below

The Project is located within the areas covered by the Montachusett Regional Planning Commission ("MRPC"). Montachusett Regional Strategic Framework Plan describes the Region's plans specific to Housing, Land Use, Economic Development, Historic Preservation, Open Space Preservation, Community Development, Energy and Water Management. Policy documents developed by this Commission reviewed growth trends within the region and outlined sets of strategic goals and policies aimed at promoting sound land use planning. They evaluated how growth trends are likely to affect development within their regions as well as in each subregion in the future. The regional objective and goals in the document are primarily concerned with promoting equal housing rights, promoting economic activity that retains and attracts income, and preserving and enhancing the availability of open space. Utility facilities or services are not explicitly addressed.

As noted previously, the purpose of this Project is to undertake necessary upgrades and improvements to the existing electrical transmission system so it may continue to provide safe, reliable electric power and to maintain compliance with regional and national electric standards. The Project is within an existing ROW, and no new cross-country ROWs are proposed. As a result, this Project is consistent with the policies contained in the planning documents, and a safe, reliable source of electric power is vital to the overall well-being of these communities.

RARE SPECIES SECTION

I. Thresholds / Permits

A. Will the project meet or exceed any review thresholds related to **rare species or habitat** (see 301 CMR 11.03(2))? **X** Yes ___ No; if yes, specify, in quantitative terms:

ENF: Rare Species - taking of an endangered or threatened species or species of special concern, provided that the Project site is two or more acres and includes an area mapped as a Priority Site of Rare Species Habitats and Exemplary Natural Communities. (301 CMR 11.03(2)(b)(2)).

Consultations are ongoing with NHESP but a take is anticipated.

(NOTE: If you are uncertain, it is recommended that you consult with the Natural Heritage and Endangered Species Program (NHESP) prior to submitting the ENF.)

B. Does the project require any state permits related to **rare species or habitat**? **X** Yes ___ No

C. Does the project site fall within mapped rare species habitat (Priority or Estimated Habitat?) in the current Massachusetts Natural Heritage Atlas (attach relevant page)? **X** Yes ___ No.

D. If you answered "No" to all questions A, B and C, proceed to the **Wetlands, Waterways, and Tidelands Section**. If you answered "Yes" to either question A or question B, fill out the remainder of the Rare Species section below.

II. Impacts and Permits

A. Does the project site fall within Priority or Estimated Habitat in the current Massachusetts Natural Heritage Atlas (attach relevant page)? **X** Yes ___ No. If yes,

- 1. Have you consulted with the Division of Fisheries and Wildlife Natural Heritage and Endangered Species Program (NHESP)? **X** Yes ___ No; if yes, have you received a determination as to whether the project will result in the "take" of a rare species? ___ Yes **X** No; if yes, attach the letter of determination to this submission.

Consultations with NHESP are ongoing for the Project. A MESA Checklist, NHESP File No: 22-41082 for Access Road Upgrades and Geotechnical Borings was issued on 6/5/2022.

2. Will the project "take" an endangered, threatened, and/or species of special concern in accordance with M.G.L. c.131A (see also 321 CMR 10.04)? ___ Yes ___ No; if yes, provide a summary of proposed measures to minimize and mitigate rare species impacts

Consultations with NHESP are ongoing for the Project. A MESA Checklist, NHESP File No: 22-41082 for Access Road Upgrades and Geotechnical Borings was issued on 6/5/2022.

3. Which rare species are known to occur within the Priority or Estimated Habitat?

The Project area overlaps with Estimated and/or Priority Habitat for three (3) bird, three (3) herptile, two (2) insect, and one (1) plant species. The names and locations of these species are not provided, as requested by MA NHESP.

4. Has the site been surveyed for rare species in accordance with the Massachusetts Endangered Species Act? ___ Yes **X** No

4. If your project is within Estimated Habitat, have you filed a Notice of Intent or received an Order of Conditions for this project? ___ Yes **X** No; if yes, did you send a copy of the Notice of Intent to the Natural Heritage and Endangered Species Program, in accordance with the Wetlands Protection Act regulations? ___ Yes ___ No

Notices of Intent will be submitted at a later date to each municipality as required under the WPA. Copies of the Notice of Intent ("NOI") will be provided to the NHESP in accordance with the regulations at that time.

B. Will the project "take" an endangered, threatened, and/or species of special concern in accordance with M.G.L. c.131A (see also 321 CMR 10.04)? Yes No; if yes, provide a summary of proposed measures to minimize and mitigate impacts to significant habitat:

Consultations with NHESP are ongoing for the Project. A MESA Checklist, NHESP File No: 22-41082 for Access Road Upgrades and Geotechnical Borings was issued on 6/5/2022.

WETLANDS, WATERWAYS, AND TIDELANDS SECTION

I. Thresholds / Permits

A. Will the project meet or exceed any review thresholds related to **wetlands, waterways, and tidelands** (see 301 CMR 11.03(3))? Yes
 No; if yes, specify, in quantitative terms:

<u>MEPA Threshold</u>	<u>Project Triggering Activity</u> ¹³
<p>EIR: Wetlands, Waterways and Tidelands: Alteration of one or more acres of bordering vegetated wetlands (BVW). (301 CMR 11.03(3)(a)(1)(a))</p>	<p>Bordering Vegetated Wetland: 2,868,580 sf (~66 acres)</p>
<p>EIR: Wetlands, Waterways and Tidelands: Alteration of ten or more acres of any other wetlands. (301 CMR 11.03(3)(a)(1)(b))</p>	<p><i>Temporary- approximately 2,200,651 sf construction matting (~51 acres)</i></p>
<p>ENF: Wetlands, Waterways and Tidelands: Alteration of 500 or more linear feet of bank along a fish run or inland bank. (301 CMR 11.03(3)(b)(1)(b))</p>	<p><i>Permanent- approximately 1,896 sf fill from new/or replacement structure foundations. Approximately, 666,032 sf (~15 acres) of forested wetland conversion due to tree removals.</i></p>
<p>ENF: Wetlands, Waterways and Tidelands: Alteration of one half or more acres of any other wetlands. (301 CMR 11.03(3)(b)(1)(f))</p>	<p>Riverfront Area: 2,614,816 sf (~60 acres)</p>
	<p><i>Temporary - approximately 513,137 sf (~12 acres) construction matting.</i></p> <p><i>Permanent – approximately 3,476 sf fill from new/or replacement structure foundations; 1,349,406 sf (~31 acres) for cut/fill for work envelopes, pull pads, access and retaining walls; and 748,796 sf (~17 acres) tree removals.</i></p>
	<p>Bordering Land Subject to Flooding: 389,517 sf (~9 acres)¹⁴</p> <p><i>Temporary – approximately 13,939 sf construction matting.</i></p> <p><i>Permanent – approximately 632 sf of fill from structure foundations; and 81,022 sf (~2 acre) of tree removals; and 237,402 sf (~5 acres) of cut and fill; 56,522 sf (~ 1 acre) of road building.</i></p>
	<p>Isolated Wetlands: 85,021 sf (~2 acres)</p> <p><i>Temporary – approximately 73,181 construction matting</i></p> <p><i>Permanent - approximately 79 sf of fill from one (1) structure foundation. Approximately, 11,761 sf of forested wetland conversion due to tree removals.</i></p>
	<p>Inland Bank: 94,526 sf</p> <p><i>Temporary¹⁵ – approximately 67,954 sf of construction matting which is anticipated to span the stream bank and not result in an impact.</i></p>

13 Note that impacts located within the limits of Riverfront Area overlap with impacts to BLSF, BVW, and the 100-ft Buffer Zone. Therefore, the total impacts to the Project Site are not equal to the sum of alterations.

14 56,521 sf of access road and 237,402 sf of cut associated with work envelopes, pull pads and access proposed in BLSF; however, areas will be overexcavated and not result in fill.

15 In most cases, construction mat crossing will span the Bank of rivers and stream; however, the potential for alteration has been accounted for in the review of MEPA Thresholds.

	<i>Permanent – approximately 26,572 sf of tree removals.</i>
--	--------------------------------------------------------------

B. Does the project require any state permits (or a local Order of Conditions) related to **wetlands, waterways, or tidelands**? Yes ___ No; if yes, specify which permit:

- *Individual Section 401 Water Quality Certification (“WQC”) and Variance from MassDEP.*
- *Orders of Conditions from local Conservation Commissions.*

C. If you answered "No" to both questions A and B, proceed to the **Water Supply Section**. If you answered "Yes" to either question A or question B, fill out the remainder of the Wetlands, Waterways, and Tidelands Section below.

II. Wetlands Impacts and Permits

A. Does the project require a new or amended Order of Conditions under the Wetlands Protection Act (M.G.L. c.131A)? Yes ___ No; if yes, has a Notice of Intent been filed? ___ Yes No;

Note: while Notices of Intent have not yet been submitted for this specific Project, several have been filed for geotechnical borings which will be used to inform the final scope and design.

if yes, list the date and MassDEP file number: _____;
 if yes, has a local Order of Conditions been issued? ___ Yes ___ No;
 Was the Order of Conditions appealed? ___ Yes ___ No.
 Will the project require a Variance from the Wetlands regulations? ___ Yes No.

B. Describe any proposed permanent or temporary impacts to wetland resource areas located on the project site:

Impacts are proposed within Bordering Vegetated Wetland, Inland Bank, Riverfront Area and Bordering Land Subject to Flooding delineated within the Project area. In addition, intermittent and perennial streams were also identified on site. See the wetland resource area descriptions in Section 4: Wetlands and Wildlife and Appendix F: Supplemental Wetlands Information. The MEPA General Purpose Plans in Appendix A depict these resource areas on the Project plans. The temporary and permanent impacts are identified in Section 4.

C. Estimate the extent and type of impact that the project will have on wetland resources, and indicate whether the impacts are temporary or permanent:

<u>Coastal Wetlands</u>	<u>Area (square feet) or</u>	<u>Temporary or</u>	
	<u>Length (linear feet)</u>	<u>Permanent Impact?</u>	

Land Under the Ocean _____

Designated Port Areas _____

Coastal Beaches _____

Coastal Dunes _____

Barrier Beaches _____

Coastal Banks _____

Rocky Intertidal Shores _____

Salt Marshes _____

Land Under Salt Ponds _____

Land Containing Shellfish _____

Fish Runs _____

Land Subject to Coastal Storm Flowage _____

Inland Wetlands

Bank (lf) ~8,599 lf; ~ 4,180 lf temporary; permanent

Bordering Vegetated Wetlands ~2,200,651 sf; ~667,928 sf temporary; permanent

Isolated Vegetated Wetlands ~73,181 sf; 11,840 sf temporary; permanent

Land under Water ~32,206 sf; 158 sf temporary; permanent

Isolated Land Subject to Flooding _____ N/A _____ N/A _____

Bordering Land Subject to Flooding ~13,939 sf; ~375,578 sf temporary; permanent

Riverfront Area ~513,137 sf; ~2,101,679 sf temporary; permanent

D. Is any part of the project:

1. proposed as a **limited project**? Yes ___ No; if yes, what is the area (in sf)?

The entire project can be considered a limited project.

2. the construction or alteration of a **dam**? ___ Yes No; if yes, describe:

3. fill or structure in a **velocity zone** or **regulatory floodway**? Yes ___ No

4. dredging or disposal of dredged material? ___ Yes No; if yes, describe the volume _____ of dredged material and the proposed disposal site:

5. a discharge to an **Outstanding Resource Water (ORW)** or an **Area of Critical Environmental Concern (ACEC)**? Yes ___ No

6. subject to a wetlands restriction order? ___ Yes No; if yes, identify the area (in sf):

7. located in buffer zones? Yes ___ No; if yes, how much (in sf) _____

4,699,005 sf (approximately 108 acres); Primarily due to cut/fill for work envelopes, and access road establishment and improvements. All areas altered will be revegetated with native vegetation.

E. Will the project:

1. be subject to a local wetlands ordinance or bylaw? Yes ___ No

2. alter any federally-protected wetlands not regulated under state law? Yes ___ No; if what is the area (sf)? yes,

For the purpose of this filing, it assumed that all Isolated Vegetated Wetlands not meeting the criteria for Isolated Land Subject to Flooding are federally jurisdictional. Temporary impacts total approximately 73,181 sf and permanent impacts total approximately 11,840 sf.

III. Waterways and Tidelands Impacts and Permits

A. Does the project site contain waterways or tidelands (including filled former tidelands) that are subject to the Waterways Act, M.G.L.c.91? Yes ___ No; if yes, is there a current Chapter 91 License or Permit affecting the project site? ___ Yes No; if yes, list the date and license or permit number and provide a copy of the historic map used to determine extent of filled tidelands:

Pursuant to 310 CMR 9.05(3)(g)(1), because a final Order of Conditions issued under M.G.L. c. 131, §40 and 310 CMR 10.00 will be issued for all Project waterways crossing, the crossings do not require authorization under c. 91. Please refer to Section 11: Regulatory Compliance in the Project Narrative for additional detail.

B. Does the project require a new or modified license or permit under M.G.L.c.91? Yes No; if yes, how many acres of the project site subject to M.G.L.c.91 will be for non-water-dependent use?

Current ___ Change ___ Total ___

If yes, how many square feet of solid fill or pile-supported structures (in sf)?

C. For non-water-dependent use projects, indicate the following:

Area of filled tidelands on the site: ___ N/A

Area of filled tidelands covered by buildings N/A

For portions of site on filled tidelands, list ground floor uses and area of each use:

Does the project include new non-water-dependent uses located over flowed tidelands?

___ Yes No

Height of building on filled tidelands ___ N/A

Also show the following on a site plan: Mean High Water, Mean Low Water, Water-dependent Use Zone, location of uses within buildings on tidelands, and interior and exterior areas and facilities dedicated for public use, and historic high and historic low water marks.

D. Is the project located on landlocked tidelands? ___ Yes No; if yes, describe the project's impact on the public's right to access, use and enjoy jurisdictional tidelands and describe measures the project will implement to avoid, minimize or mitigate any adverse impact:

E. Is the project located in an area where low groundwater levels have been identified by a municipality or by a state or federal agency as a threat to building foundations? ___ Yes **X** No; if yes, describe the project's impact on groundwater levels and describe measures the project will implement to avoid, minimize or mitigate any adverse impact:

F. Is the project non-water-dependent **and** located on landlocked tidelands **or** waterways or tidelands subject to the Waterways Act **and** subject to a mandatory EIR? ___ Yes **X** No;

(NOTE: If yes, then the project will be subject to Public Benefit Review and Determination.)

G. Does the project include dredging? ___ Yes **X** No; if yes, answer the following questions:

What type of dredging? Improvement ___ Maintenance ___ Both ___

What is the proposed dredge volume, in cubic yards (cys) _____

What is the proposed dredge footprint ___ length (ft) ___ width (ft) ___ depth (ft);

Will dredging impact the following resource areas?

Intertidal Yes ___ No ___; if yes, ___ sq ft

Outstanding Resource Waters Yes ___ No ___; if yes, ___ sq ft

Other resource area (i.e. shellfish beds, eel grass beds) Yes ___ No ___; if yes ___ sq ft

If yes to any of the above, have you evaluated appropriate and practicable steps to: 1) avoidance; 2) if avoidance is not possible, minimization; 3) if either avoidance or minimize is not possible, mitigation?

If no to any of the above, what information or documentation was used to support this determination?

Provide a comprehensive analysis of practicable alternatives for improvement dredging in accordance with 314 CMR 9.07(1)(b). Physical and chemical data of the sediment shall be included in the comprehensive analysis.

Sediment Characterization

Existing radation analysis results? ___ Yes ___ No; if yes, provide results.

Existing chemical results for parameters listed in 314 CMR 9.07(2)(b)6? ___ Yes ___ No; if yes, provide results.

Do you have sufficient information to evaluate feasibility of the following management options for dredged sediment? If yes, check the appropriate option.

Beach Nourishment ___

Unconfined Ocean Disposal ___

Confined Disposal:

Confined Aquatic Disposal (CAD) ___

Confined Disposal Facility (CDF) ___

Landfill Reuse in accordance with COMM-97-001 ___

Shoreline Placement ___

Upland Material Reuse ____

In-State landfill disposal ____

Out-of-state landfill disposal ____

(NOTE: This information is required for a 401 Water Quality Certification.)

IV. Consistency:

A. Does the project have effects on the coastal resources or uses, and/or is the project located within the Coastal Zone? ____ Yes **X** No; if yes, describe these effects and the projects consistency with the policies of the Office of Coastal Zone Management:

B. Is the project located within an area subject to a Municipal Harbor Plan? ____ Yes **X** No; if yes, identify the Municipal Harbor Plan and describe the project's consistency with that plan:

WATER SUPPLY SECTION

I. Thresholds / Permits

- A. Will the project meet or exceed any review thresholds related to **water supply** (see 301 CMR 11.03(4))? ___ Yes **X** No; if yes, specify, in quantitative terms:
- B. Does the project require any state permits related to **water supply**? ___ Yes **X** No; if yes, specify which permit:
- C. If you answered "No" to both questions A and B, proceed to the **Wastewater Section**. If you answered "Yes" to either question A or question B, fill out the remainder of the Water Supply Section below.

II. Impacts and Permits

A. Describe, in gallons per day (gpd), the volume and source of water use for existing and proposed activities at the project site:

	<u>Existing</u>	<u>Change</u>	<u>Total</u>
Municipal or regional water supply	_____	_____	_____
Withdrawal from groundwater	_____	_____	_____
Withdrawal from surface water	_____	_____	_____
Interbasin transfer	_____	_____	_____

(NOTE: Interbasin Transfer approval will be required if the basin and community where the proposed water supply source is located is different from the basin and community where the wastewater from the source will be discharged.)

- B. If the source is a municipal or regional supply, has the municipality or region indicated that there is adequate capacity in the system to accommodate the project? ___ Yes ___ No
- C. If the project involves a new or expanded withdrawal from a groundwater or surface water source, has a pumping test been conducted? ___ Yes ___ No; if yes, attach a map of the drilling sites and a summary of the alternatives considered and the results. _____
- D. What is the currently permitted withdrawal at the proposed water supply source (in gallons per day)? _____ Will the project require an increase in that withdrawal? ___ Yes ___ No; if yes, then how much of an increase (gpd)? _____
- E. Does the project site currently contain a water supply well, a drinking water treatment facility, water main, or other water supply facility, or will the project involve construction of a new facility? ___ Yes ___ No. If yes, describe existing and proposed water supply facilities at the project site:

Permitted	Existing	Avg	<u>Project Flow</u>	<u>Total</u>
-----------	----------	-----	---------------------	--------------

	<u>Flow</u>	<u>Daily Flow</u>
Capacity of water supply well(s) (gpd)	_____	_____
Capacity of water treatment plant (gpd)	_____	_____

F. If the project involves a new interbasin transfer of water, which basins are involved, what is the direction of the transfer, and is the interbasin transfer existing or proposed?

G. Does the project involve:

1. new water service by the Massachusetts Water Resources Authority or other agency of _____ the Commonwealth to a municipality or water district? Yes No
2. a Watershed Protection Act variance? Yes No; if yes, how many acres of alteration?
3. a non-bridged stream crossing 1,000 or less feet upstream of a public surface drinking water supply for purpose of forest harvesting activities? Yes No

III. Consistency

Describe the project's consistency with water conservation plans or other plans to enhance water resources, quality, facilities and services:

WASTEWATER SECTION

I. Thresholds / Permits

A. Will the project meet or exceed any review thresholds related to **wastewater** (see 301 CMR 11.03(5))? ___ Yes **X** No; if yes, specify, in quantitative terms:

B. Does the project require any state permits related to **wastewater**? ___ Yes **X** No; if yes, specify which permit:

C. If you answered "No" to both questions A and B, proceed to the **Transportation -- Traffic Generation Section**. If you answered "Yes" to either question A or question B, fill out the remainder of the Wastewater Section below.

II. Impacts and Permits

A. Describe the volume (in gallons per day) and type of disposal of wastewater generation for existing and proposed activities at the project site (calculate according to 310 CMR 15.00 for septic systems or 314 CMR 7.00 for sewer systems):

	<u>Existing</u>	<u>Change</u>	<u>Total</u>
Discharge of sanitary wastewater	_____	_____	_____
Discharge of industrial wastewater	_____	_____	_____
TOTAL	_____	_____	_____

	<u>Existing</u>	<u>Change</u>	<u>Total</u>
Discharge to groundwater	_____	_____	_____
Discharge to outstanding resource water	_____	_____	_____
Discharge to surface water	_____	_____	_____
Discharge to municipal or regional wastewater facility	_____	_____	_____
TOTAL	_____	_____	_____

B. Is the existing collection system at or near its capacity? ___ Yes ___ No; if yes, then describe the measures to be undertaken to accommodate the project's wastewater flows:

C. Is the existing wastewater disposal facility at or near its permitted capacity? ___ Yes ___ No; if yes, then describe the measures to be undertaken to accommodate the project's wastewater flows:

D. Does the project site currently contain a wastewater treatment facility, sewer main, or other wastewater disposal facility, or will the project involve construction of a new facility? ___ Yes

___ No; if yes, describe as follows:

	<u>Permitted</u>	Existing	Avg	<u>Project Flow</u>	<u>Total</u>
	<u>Daily Flow</u>				
Wastewater treatment plant capacity					
(in gallons per day)	_____	_____	_____	_____	_____

E. If the project requires an interbasin transfer of wastewater, which basins are involved, what is the direction of the transfer, and is the interbasin transfer existing or new?

(NOTE: Interbasin Transfer approval may be needed if the basin and community where wastewater will be discharged is different from the basin and community where the source of water supply is located.)

F. Does the project involve new sewer service by the Massachusetts Water Resources Authority (MWRA) or other Agency of the Commonwealth to a municipality or sewer district? ___ Yes ___ No

G. Is there an existing facility, or is a new facility proposed at the project site for the storage, treatment, processing, combustion or disposal of sewage sludge, sludge ash, grit, screenings, wastewater reuse (gray water) or other sewage residual materials? ___ Yes ___ No; if yes, what is the capacity (tons per day):

	<u>Existing</u>	<u>Change</u>	<u>Total</u>
Storage	_____	_____	_____
Treatment	_____	_____	_____
Processing	_____	_____	_____
Combustion	_____	_____	_____
Disposal	_____	_____	_____

H. Describe the water conservation measures to be undertaken by the project, and other wastewater mitigation, such as infiltration and inflow removal.

III. Consistency

- A. Describe measures that the proponent will take to comply with applicable state, regional, and local plans and policies related to wastewater management:

- B. If the project requires a sewer extension permit, is that extension included in a comprehensive wastewater management plan? ___ Yes ___ No; if yes, indicate the EEA number for the plan and whether the project site is within a sewer service area recommended or approved in that plan:

TRANSPORTATION SECTION (TRAFFIC GENERATION)

I. Thresholds / Permit

A. Will the project meet or exceed any review thresholds related to **traffic generation** (see 301 CMR 11.03(6))? Yes No; if yes, specify, in quantitative terms:

C. Does the project require any state permits related to **state-controlled roadways**? Yes No; if yes, specify which permit:

State Highway Access Permit for Non-Municipal Utility

- *Winchendon, Baldwinville State Road (Route 202)*
- *Westminster, State Road East*
- *Westminster, Depot Road/Narrows Road*
- *Westminster, Route 2*
- *Westminster/ Fitchburg, Route 2 and associated ramps (Exit 27)*
- *Fitchburg, Route 2 and associated ramps and Princeton Road (Exit 28)*
- *Fitchburg/Leominster, Route 2*
- *Leominster, Central Street*

State Highway Permanent Access Permit for Non-Municipal Utility

- *Proposed structures within Highway Layout¹⁶*
- *Proposed access road within a DOT owned parcel*

MassDOT is expected to review the Project for:

- *Overhead wire crossings of state highways*
- *Temporary access during construction onto the NEP Project ROW from state highways*
- *Permanent Access Permit for new access road and proposed structures within the Highway Layout*

C. If you answered "No" to both questions A and B, proceed to the **Roadways and Other Transportation Facilities Section**. If you answered "Yes" to either question A or question B, fill out the remainder of the Traffic Generation Section below.

II. Traffic Impacts and Permits

A. Describe existing and proposed vehicular traffic generated by activities at the project site:

	<u>Existing</u>	<u>Change</u>	<u>Total</u>
Number of parking spaces	N/A	N/A	N/A
Number of vehicle trips per day	N/A	N/A	N/A
ITE Land Use Code(s):	N/A	N/A	N/A

16 NEP is evaluating the location of replacements structures along Depot Road in Westminster. The original easement CRT 87 (*Charles H. Dupee et ux*), granted rights to NEP that allow the structure relocation. In addition, the highway taking/relocation in 1985 reserved the rights of all electric transmission easements. The structure relocation is being proposed as an "in-kind" replacement. Should MassDOT deem it to be otherwise, a permanent access permit may be required. NEP will consult with MassDOT.

The Project will not cause permanent traffic impacts and is not anticipated to cause significant temporary traffic impacts. During construction, the shield wires and conductors will be installed using tensioning equipment to pull the conductors through the stringing blocks. When this activity occurs near state roadways, temporary guard structures or boom trucks may be placed at road and highway crossings to ensure public safety. NEP is reviewing the proposed location of guard structures.

Proposed construction traffic will be temporary in nature, occurring along different sections of NEP’s Project ROW during the various stages of construction. Traffic will be limited to construction-related vehicles accessing the utility ROW using existing routes off state highways. Traffic volume during construction or maintenance of the utility line will not significantly affect existing volumes or adversely impact the ability of existing traffic to safely navigate the roadway.

B. What is the estimated average daily traffic on roadways serving the site?

	<u>Roadway</u>	<u>Existing</u>	<u>Change</u>	<u>Total</u>
1.	_____	_____	_____	_____
2.	_____	_____	_____	_____
3.	_____	_____	_____	_____

Intermittent construction-related traffic associated with Project construction will occur over the entire construction period. Construction equipment typically will gain access to the ROWs from public roadways crossing the ROWs in various locations along the route. Because each of the construction tasks will occur at different times and locations over the course of the construction, traffic will be intermittent at these entry roadways. Traffic will consist of vehicles ranging from pick-up trucks to heavy construction equipment to large trailers delivering materials.

Proposed construction traffic will be temporary in nature, occurring along different sections of NEP’s Project ROW during the various stages of construction. Traffic will be limited to construction-related vehicles accessing the utility ROW using existing routes off state highways. Traffic volume during construction or maintenance of the utility line will not significantly affect existing volumes or adversely impact the ability of existing traffic to safely navigate the roadway. A detailed description on traffic on roadways is provided in the Project Narrative (Section 10.4 Construction Traffic and Equipment).

C. If applicable, describe proposed mitigation measures on state-controlled roadways that the _____ project proponent will implement:

MassDOT Districts 2 & 3 will be contacted to discuss specific design information and anticipated Project activities within highway jurisdiction. With MassDOT’s input, Traffic Management Plans with complete details of proposed work will be developed and submitted to MassDOT for review and approval prior to the start of Project construction. Enforceable commitments in the Traffic Management Plans will be carried out by NEP to ensure that all proposed traffic mitigation strategies will be implemented as the Project proceeds. Such strategies may include, as appropriate, traffic management procedures; construction time restrictions; signage; installation of track pads to minimize soil in roadways; and/or restoration of vegetation along soft shoulders after construction. All work will occur in accordance with NEP Policy for ROW Access, Maintenance _____ and _____ Construction

Best Management Practices (please refer to the Project Narrative, and Appendix C: National Grid Environmental Guidance Document (“EG-303”)).

- D. How will the project implement and/or promote the use of transit, pedestrian and bicycle facilities and services to provide access to and from the project site?

Not applicable.

- C. Is there a Transportation Management Association (TMA) that provides transportation demand management (TDM) services in the area of the project site? ___ Yes ___ No; if yes, describe if and how will the project will participate in the TMA:

Not applicable.

- D. Will the project use (or occur in the immediate vicinity of) water, rail, or air transportation facilities? Yes ___ No; if yes, generally describe:

Project activities will occur in the immediate vicinity of the following rail lines:

- **CSX Fitchburg Line - Sterling, MA**
- **Patriot Corridor Line - Athol & Gardner, MA**

- E. If the project will penetrate approach airspace of a nearby airport, has the proponent filed a Massachusetts Aeronautics Commission Airspace Review Form (780 CMR 111.7) and a Notice of Proposed Construction or Alteration with the Federal Aviation Administration (FAA) (CFR Title 14 Part 77.13, forms 7460-1 and 7460-2)?

The A1/B2 ROW is approximately 3.25 miles away from the nearest airport (“Fitchburg Municipal Airport”). Since Project activities are greater than two (2) miles from the nearest Municipal Airport Runway, a Massachusetts Aeronautics Commission Airspace Review Form is not required. Project activities are greater than four (4) miles from a major airport that has a runway long enough to trigger a Federal Aviation Administration (“FAA”) review.

III. Consistency

Describe measures that the proponent will take to comply with municipal, regional, state, and federal plans and policies related to traffic, transit, pedestrian and bicycle transportation facilities and services:

Project construction will not affect transit, pedestrian, or bicycle transportation facilities since work will primarily occur on a cross-country NEP ROW, which is not designated for public use. The Project is consistent with federal, state, regional and local plans and policies; minimal, if any, impacts related to roadways or other transportation facilities are anticipated.

TRANSPORTATION SECTION (ROADWAYS AND OTHER TRANSPORTATION FACILITIES)

I. Thresholds

A. Will the project meet or exceed any review thresholds related to **roadways or other transportation facilities** (see 301 CMR 11.03(6))?
___ Yes **X** No; if yes, specify, in quantitative terms:

B. Does the project require any state permits related to **roadways or other transportation facilities**? ___ Yes **X** No; if yes, specify which permit:

C. If you answered "No" to both questions A and B, proceed to the **Energy Section**. If you answered "Yes" to either question A or question B, fill out the remainder of the Roadways Section below.

II. Transportation Facility Impacts

A. Describe existing and proposed transportation facilities in the immediate vicinity of the project site:

B. Will the project involve any

- 1. Alteration of bank or terrain (in linear feet)? _____
- 2. Cutting of living public shade trees (number)? _____
- 3. Elimination of stone wall (in linear feet)? _____

III. Consistency -- Describe the project's consistency with other federal, state, regional, and local plans and policies related to traffic, transit, pedestrian and bicycle transportation facilities and services, including consistency with the applicable regional transportation plan and the Transportation Improvements Plan (TIP), the State Bicycle Plan, and the State Pedestrian Plan:

ENERGY SECTION

I. Thresholds / Permits

A. Will the project meet or exceed any review thresholds related to **energy** (see 301 CMR 11.03(7))?

Yes No; if yes, specify, in quantitative terms:

B. Does the project require any state permits related to **energy**? Yes No; if yes, specify which permit:

Energy Facilities Siting Board, Approval under M.G.L. c.164 § 69J

Department of Public Utilities, Approval to Construct under M.G.L. c.164 § 72

C. If you answered "No" to both questions A and B, proceed to the **Air Quality Section**. If you answered "Yes" to either question A or question B, fill out the remainder of the Energy Section below.

II. Impacts and Permits

A. Describe existing and proposed energy generation and transmission facilities at the project site:

	<u>Existing</u>	<u>Change</u>	<u>Total</u>
Capacity of electric generating facility (megawatts)	N/A	N/A	N/A
Length of fuel line (in miles)	N/A	N/A	N/A
Length of transmission lines (in miles)	54 Miles	N/A	54 Miles
Capacity of transmission lines (in kilovolts)	69 kV	115kV	115kV

B. If the project involves construction or expansion of an electric generating facility, what are:

1. the facility's current and proposed fuel source(s)? N/A
2. the facility's current and proposed cooling source(s)? N/A

C. If the project involves construction of an electrical transmission line, will it be located on a new, unused, or abandoned right of way?
 Yes No; if yes, please describe:

D. Describe the project's other impacts on energy facilities and services:

The Project proposes complete asset refurbishment, system improvements and the capacity to accommodate forecasted customer and renewable interconnection needs. The purpose is to ensure reliable and continuous electricity is provided to its customers within Worcester County. Although the Project will continue to transmit electricity at 69 kV, NEP has planned and designed the Project to support transmission of a higher voltage since it is anticipated 115 kV will be needed to support higher volumes of currently active and forecasted renewable energy resources in this region, within the lifetime

of the structures. NEP will also be installing OPGW, which serves a dual purpose by providing the necessary electrical grounding in the event of lightning strikes with the additional feature of enabling telecommunication along the mainline, tap lines, and between substations. This telecommunication is critical to identifying problems, such as damage to the infrastructure from storm events or storm related outages, enabling NEP to respond quickly to any problems with the transmission of electricity. In addition, due to poor access along most of the ROW corridors, access improvements or re-establishment and construction of new access will be undertaken to conduct the proposed work and support future maintenance of the proposed infrastructure.

III. Consistency

Describe the project's consistency with state, municipal, regional, and federal plans and policies for enhancing energy facilities and services:

The Project, addressing asset conditions and the need for system improvements, includes refurbishment activities to the existing electrical structures, improvements to access, installation of stormwater management features, and the installation of six (6) vertical jumper switch structures. As a result, the Project will result in the following impacts with regard to enhanced energy facilities and services:

- *Safe and reliable access to each transmission structure.*
- *Reliable and continuous electricity supply for customers, including increased reliability during extreme weather events, such as storms.*
- *Lowered probability of flashover of the insulation¹⁷ during lightning strikes.*
- *Enabling telecommunication along the transmission lines and between substations.*
- *Capacity for transmission of electricity at 115 kV to accommodate forecasted regional and customer needs within the lifetime of the structures. This includes currently active and forecasted renewable energy resources in this region.*
- *Support for future interconnections from renewable energy projects.*

These impacts align with the following regional, state, and municipal plans and policies for enhancing energy facilities and services:

- *Federal*

The Project will provide more reliable and safe electric service in the region as well as create capacity for clean energy distribution in the future. The Energy Policy Act of 2005 provides specific incentives for the generation and use of clean energy sources such as wind power and tidal power. While much of the Act pertains to gasoline sales and production of oil and gas, the Project shows alignment with the provisions of the Act which foster the development of renewable energies and the development of an overall stronger energy infrastructure.

Additionally, the Project is consistent with the Inflation Reduction Act of 2022; while newly signed into law, various Inflation Reduction Act provisions incentivize consumers' use of clean energy to

¹⁷ An unintended high voltage electric discharge over or around an insulator, or sparking between two or more adjacent conductors that might cause frequent outages.

power their homes and vehicles while other provisions enable the reduction of greenhouse gas emissions. Therefore, the Project's goal of building capacity to provide more consumers with clean energy (which is classified as zero-emission) to power their homes and vehicles shows alignment with this federal policy.

- *State*

The Global Warming Solutions Act: On August 7, 2008, Governor Patrick signed into law the Global Warming Solutions Act ("GWSA"). The GWSA established aggressive greenhouse gas ("GHG") emissions reduction targets of 25% from 1990 levels by 2020 and 80% from 1990 levels by 2050. Pursuant to the GWSA, the Secretary of EEA issued the Clean Energy & Climate Plan for 2020 in December of 2010. Among other provisions, the GWSA obligates administrative agencies such as the EFSB, in considering and issuing permits, to consider reasonably foreseeable climate change impacts (e.g., additional GHG emissions) and related effects (e.g., sea level rise).

The Project will have no adverse climate change impacts or negative effects on sea levels. Consequently, the Project is consistent with the GWSA.

Massachusetts Clean Energy and Climate Plan: Pursuant to the GWSA, as amended in 2021 by An Act Creating A Next-Generation Roadmap for Massachusetts Climate Policy, the Secretary of the Executive Office of Energy and Environmental Affairs ("EEA") has adopted the interim 2025 statewide greenhouse gas emissions and the interim 2030 greenhouse gas emissions; the emissions limits increased to at least 50% below the 1990 baseline by 2030, at least 75% below the 1990 baseline by 2040, and at least 85% below the 1990 baseline by 2050. The Plan expresses the State's vision for a future in which there is minimal reliance on fossil fuels, as well as the State's confidence that Massachusetts can help lead the clean energy transition which will mean more well-paying jobs, improved public health, reduced consumer costs, and better quality of life for all residents. As the Project will increase capacity for transmission of energy from renewable sources, the Project is consistent with the 2025/2030 CECP.

An Act Driving Clean Energy and Offshore Wind: On August 12, 2022, Governor Baker signed An Act Driving Energy and Offshore Wind into law, which, among other provisions, set an offshore wind development minimum target. As the Project will increase capacity for transmission of energy from renewable sources such as wind energy, the Project is consistent with the Act.

- *Regional*

Regional Greenhouse Gas Initiative: In January 2007, Massachusetts joined the Regional Greenhouse Gas Initiative ("RGGI"), a cooperative effort by Northeast and Mid-Atlantic States to reduce CO2 emissions from large fossil-fueled power plants. In 2018, Massachusetts joined eight other states in developing amendments to revise the RGGI, including reductions to the regional cap and other programmatic changes. As the Project will increase capacity for transmission of energy from renewable sources, which do not produce carbon emissions as part of the electricity generation process, the Project is consistent with the RGGI.

- *Municipal*

The Green Communities Act: On July 2, 2008, Massachusetts Governor Deval Patrick signed into law the Green Communities Act. The Green Communities Act is a comprehensive, multi-faceted energy reform bill that encourages energy and building efficiency, promotes renewable energy, creates green communities, implements elements of the Regional Greenhouse Gas Initiative, and provides market incentives and funding for various types of energy generation. The Green Communities Act (as amended and supplemented by St. 2012, c. 209, An Act Relative to Competitively Priced Electricity) can be expected to result in greater renewable supplies and substantial new conservation initiatives in future years.

In order to achieve Green Community Designation, municipalities must meet five criteria: (1) Criterion 1 is met by passing zoning in designated locations for the as-of-right siting of renewable or alternative energy generating facilities, research and development facilities, or manufacturing facilities; (2) Criterion 2 is met by adopting an expedited application and permitting of one year at most, under which facilities interested in locating their facility in a designated renewable zone may be sites within the municipality; (3) Criterion 3 is met by (i) establishing an energy baseline inventory for municipal buildings and facilities, and (ii) adopting an Energy Reduction Plan demonstration a reduction of 20% of energy use after five years of implementation; (4) Criterion 4 is met if all departments within a Green Community purchase fuel-efficient vehicles for municipal use, whenever such vehicles are commercially available and practicable; and (5) Criterion 5 is met if municipalities minimize the life-cycle cost of all newly constructed homes and buildings.

Warwick, Royalston, Winchendon, Gardner, Westminster, Fitchburg, Leominster, Athol, and Sterling are all designated Green Communities.

The improvements to the transmission system in the region will further the goals of the Green Communities Act by assuring reliable, efficient energy supply. The Project also supports the communities' interest in an energy supply from renewable energy sources. The Project, therefore, advances the important policy objectives of the Green Communities Act.

The Massachusetts Municipal Vulnerability Preparedness ("MVP") Grant Program : The MVP Grant Program was created in 2017, as result of Executive Order No. 569, signed by Governor Charlie Baker on September 16, 2016. The Program provides support for cities and towns in Massachusetts to identify climate hazards, assess vulnerabilities, and develop action plans to improve resilience to climate change. Communities that complete the MVP Planning Grant process become designated as an MVP Community and are eligible for MVP Action Grant funding to implement the priority actions identified through the planning process.

Warwick, Royalston, Winchendon, Gardner, Westminster, Fitchburg, Leominster, Athol, and Sterling have all achieved MVP designation. All nine, through their planning processes, identified power outages as vulnerabilities in their communities. Additionally, some of the plans also addressed transitions to clean energy sources.

As the Project will increase reliability and decrease likelihood of outages during extreme weather events, as well as capacity for transmission of energy from renewable sources, the Project is consistent with MVP.

AIR QUALITY SECTION

I. Thresholds

A. Will the project meet or exceed any review thresholds related to **air quality** (see 301 CMR 11.03(8))? ___ Yes **X** No; if yes, specify, in quantitative terms:

B. Does the project require any state permits related to **air quality**? ___ Yes **X** No; if yes, specify which permit:

C. If you answered "No" to both questions A and B, proceed to the **Solid and Hazardous Waste Section**. If you answered "Yes" to either question A or question B, fill out the remainder of the Air Quality Section below.

II. Impacts and Permits

A. Does the project involve construction or modification of a major stationary source (see 310 CMR 7.00, Appendix A)? ___ Yes ___ No; if yes, describe existing and proposed emissions (in tons per day) of:

	<u>Existing</u>	<u>Change</u>	<u>Total</u>
Particulate matter	_____	_____	_____
Carbon monoxide	_____	_____	_____
Sulfur dioxide	_____	_____	_____
Volatile organic compounds	_____	_____	_____
Oxides of nitrogen	_____	_____	_____
Lead	_____	_____	_____
Any hazardous air pollutant	_____	_____	_____
Carbon dioxide	_____	_____	_____

B. Describe the project's other impacts on air resources and air quality, including noise impacts:

III. Consistency

A. Describe the project's consistency with the State Implementation Plan:

B. Describe measures that the proponent will take to comply with other federal, state, regional, and local plans and policies related to air resources and air quality:

SOLID AND HAZARDOUS WASTE SECTION

I. Thresholds / Permits

A. Will the project meet or exceed any review thresholds related to **solid or hazardous waste** (see 301 CMR 11.03(9))? ___ Yes **X** No; if yes, specify, in quantitative terms:

B. Does the project require any state permits related to **solid and hazardous waste**? ___ Yes **X** No; if yes, specify which permit:

C. If you answered "No" to both questions A and B, proceed to the **Historical and Archaeological Resources Section**. If you answered "Yes" to either question A or question B, fill out the remainder of the Solid and Hazardous Waste Section below.

II. Impacts and Permits

A. Is there any current or proposed facility at the project site for the storage, treatment, processing, combustion or disposal of solid waste? ___ Yes ___ No; if yes, what is the volume (in tons per day) of the capacity:

	<u>Existing</u>	<u>Change</u>	<u>Total</u>
Storage	_____	_____	_____
Treatment, processing	_____	_____	_____
Combustion	_____	_____	_____
Disposal	_____	_____	_____

B. Is there any current or proposed facility at the project site for the storage, recycling, treatment or disposal of hazardous waste? ___ Yes ___ No; if yes, what is the volume (in tons or gallons per day) of the capacity:

	<u>Existing</u>	<u>Change</u>	<u>Total</u>
Storage	_____	_____	_____
Recycling	_____	_____	_____
Treatment	_____	_____	_____
Disposal	_____	_____	_____

C. If the project will generate solid waste (for example, during demolition or construction), describe alternatives considered for re-use, recycling, and disposal:

D. If the project involves demolition, do any buildings to be demolished contain asbestos?

Yes No

E. Describe the project's other solid and hazardous waste impacts (including indirect impacts):

III. Consistency

Describe measures that the proponent will take to comply with the State Solid Waste Master Plan:

HISTORICAL AND ARCHAEOLOGICAL RESOURCES SECTION

I. Thresholds / Impacts

A. Have you consulted with the Massachusetts Historical Commission? Yes ___ No; if yes, attach correspondence.

See Appendix I: Correspondence.

For project sites involving lands under water, have you consulted with the Massachusetts Board of Underwater Archaeological Resources?
___ Yes No; if yes, attach correspondence

Not applicable.

B. Is any part of the project site a historic structure, or a structure within a historic district, in either case listed in the State Register of Historic Places or the Inventory of Historic and Archaeological Assets of the Commonwealth? Yes ___ No; if yes, does the project involve the demolition of all or any exterior part of such historic structure? ___ Yes No; if yes, please describe:

C. Is any part of the project site an archaeological site listed in the State Register of Historic Places or the Inventory of Historic and Archaeological Assets of the Commonwealth? Yes ___ No; if yes, does the project involve the destruction of all or any part of such archaeological site? ___ Yes No; if yes, please describe:

SWCA Environmental Consultants identified 102 inventoried historic properties and 12 historic areas in the Study Area of the Project. One property is eligible for listing in the NRHP due to its significance to the history of electric engineering and power transmission in New England. As the Project proposed to replace existing electrical structures with similar electrical structures, the Project is unlikely to cause an effect on this historic property.

SWCA Environmental Consultants initiated consultation with the MHC by submitting a Project Notification Form, a Cultural Resources Due Diligence Report, and a State Archaeologist's permit application. Additional testing was completed in 2022. None of the sites in Massachusetts are considered significant and no further survey was recommended. See Project Narrative, Section 6.

D. If you answered "No" to all parts of both questions A, B and C, proceed to the **Attachments and Certifications** Sections. If you answered "Yes" to any part of either question A or question B, fill out the remainder of the Historical and Archaeological Resources Section below.

II. Impacts

Describe and assess the project's impacts, direct and indirect, on listed or inventoried historical and archaeological resources:

As noted above, assessment of the Project's potential to adversely impact significant cultural resources is ongoing and NEP will continue to consult with the MHC to implement appropriate mitigation measures and continuing archaeological investigations.

III. Consistency

Describe measures that the proponent will take to comply with federal, state, regional, and local plans and policies related to preserving historical and archaeological resources:

NEP will coordinate with MHC such that the Project shall avoid adverse impacts to historic and/or prehistoric cultural resources to the greatest practicable extent. Should avoidance be impossible, NEP will consult with the MHC to implement appropriate mitigation measures and continuing archaeological investigations.

CLIMATE CHANGE ADAPTATION AND RESILIENCY SECTION

This section of the Environmental Notification Form (ENF) solicits information and disclosures related to climate change adaptation and resiliency, in accordance with the MEPA Interim Protocol on Climate Change Adaptation and Resiliency (the “MEPA Interim Protocol”), effective October 1, 2021. The Interim Protocol builds on the analysis and recommendations of the 2018 Massachusetts Integrated State Hazard Mitigation and Climate Adaptation Plan (SHMCAP), and incorporates the efforts of the Resilient Massachusetts Action Team (RMAT), the inter-agency steering committee responsible for implementation, monitoring, and maintenance of the SHMCAP, including the “Climate Resilience Design Standards and Guidelines” project. The RMAT team recently released the RMAT Climate Resilience Design Standards Tool, which is available [here](#).

The MEPA Interim Protocol is intended to gather project-level data in a standardized manner that will both inform the MEPA review process and assist the RMAT team in evaluating the accuracy and effectiveness of the RMAT Climate Resilience Design Standards Tool. Once this testing process is completed, the MEPA Office anticipates developing a formal Climate Change Adaptation and Resiliency Policy through a public stakeholder process. Questions about the RMAT Climate Resilience Design Standards Tool can be directed to rmat@mass.gov.

All Proponents must complete the following section, referencing as appropriate the results of the output report generated by the RMAT Climate Resilience Design Standards Tool and attached to the ENF. In completing this section, Proponents are encouraged, but not required at this time, to utilize the recommended design standards and associated Tier 1/2/3 methodologies outlined in the RMAT Climate Resilience Design Standards Tool to analyze the project design. However, Proponents are requested to respond to a [user feedback survey](#) on the RMAT website or to provide feedback to rmat@mass.gov, which will be used by the RMAT team to further refine the tool. Proponents are also encouraged to consult general guidance and best practices as described in the [RMAT Climate Resilience Design Guidelines](#).

Climate Change Adaptation and Resiliency Strategies

- I. Has the project taken measures to adapt to climate change for all of the climate parameters analyzed in the RMAT Climate Resilience Design Standards Tool (sea level rise/storm surge, extreme precipitation (urban or riverine flooding), extreme heat)? **X** Yes ___ No

Note: Climate adaptation and resiliency strategies include actions that seek to reduce vulnerability to anticipated climate risks and improve resiliency for future climate conditions. Examples of climate adaptation and resiliency strategies include flood barriers, increased stormwater infiltration, living shorelines, elevated infrastructure, increased tree canopy, etc. Projects should address any planning priorities identified by the affected municipality through the Municipal Vulnerability Preparedness (MVP) program or other planning efforts, and should consider a flexible adaptive pathways approach, an adaptation best practice that encourages design strategies that adapt over time to respond to changing climate conditions. General guidance and best practices for designing for climate risk are described in the [RMAT Climate Resilience Design Guidelines](#).

A. If no, explain why.

B. If yes, describe the measures the project will take, including identifying the planning horizon and climate data used in designing project components. If applicable, specify the return period and design storm used (e.g., 100-year, 24-hour storm).

NEP has taken steps to promote climate change adaptation and resiliency in the design of the Project. The Project will result in a more climate-ready and resilient transmission system that can

withstand more extreme weather events; address existing system capacity shortages and increased demand; and support future interconnections from renewable energy projects. In addition, NEP’s preferred solution uses substantial portions of existing ROW, thereby minimizing alteration of new land resources to construct the Project. See Project Narrative, Section 7.

C. Is the project contributing to regional adaptation strategies? Yes No; If yes, describe.

All nine municipalities have achieved MA MVP designation. All nine identified power outages as a vulnerability in their communities during Community Resilience Building workshops and associated Summary of Findings reports and sought to identify ways to improve power utility resilience. Vulnerability due to high winds, snow and ice loads, and trees were common concerns resulting in frequent and/or long duration power outages. While this project does not address local distribution, transmission line and structure replacements are intended to result in a more reliable and resilient transmission system supporting these communities.

II. Has the Proponent considered alternative locations for the project in light of climate change risks?

Yes No

A. If no, explain why.

The proposed Project location, within the existing ROW, is the only location that meets the identified Project need and reliability, addresses the various regulatory objectives, minimizes environmental impacts, and provides a cost-effective solution to customers. Also, the Project is located outside of areas identified as vulnerable to sea level rise and coastal flooding.

B. If yes, describe alternatives considered.

III. Is the project located in Land Subject to Coastal Storm Flowage (LSCSF) or Bordering Land Subject to Flooding (BLSF) as defined in the Wetlands Protection Act? Yes No

If yes, describe how/whether proposed changes to the site’s topography (including the addition of fill) will result in changes to floodwater flow paths and/or velocities that could impact adjacent properties or the functioning of the floodplain. General guidance on providing this analysis can be found in the CZM/MassDEP Coastal Wetlands Manual, available [here](#).

The Project is not located within LSCSF; however, it is within areas of BLSF. Where new access roads are proposed within BLSF, the area will be over excavated resulting in no loss of flood storage. Concrete caisson foundations are proposed within BLSF. NEP will provide compensatory flood storage as required under state and local requirements. See Project Narrative, Section 12.

ENVIRONMENTAL JUSTICE SECTION

I. Identifying Characteristics of EJ Populations

A. If an Environmental Justice (EJ) population has been identified as located in whole or in part within 5 miles of the project site, describe the characteristics of each EJ populations as identified in the EJ Maps Viewer (i.e., the census block group identification number and EJ characteristics of “Minority,” “Minority and Income,” etc.). Provide a breakdown of those EJ populations within 1 mile of the project site, and those within 5 miles of the site.

Within the designated geographic area (“DGA”) (“1-mile”), NEP identified 18 EJ Populations within five (5) municipalities, within Athol, Fitchburg, Gardner, Lancaster and Leominster. All these municipalities are located in Worcester County. Three (3) of these EJ Populations meet the EJ characteristic of “Minority and Income”, six (6) EJ Populations meet the EJ characteristic of “Minority”, and nine (9) meet the EJ characteristic of “Income”.

Within 5-miles of the Project, NEP identified 65 EJ Populations within eight (8) municipalities, within Athol, Clinton, Fitchburg, Gardner, Lancaster, Leominster, Orange and Winchendon. All municipalities are located within Worcester County except for Orange and Winchendon which are part of Franklin County. 26 of these EJ Populations meet the EJ characteristic of “Minority and Income”, 23 EJ Populations meet the characteristic of “Minority”, 15 meet the EJ characteristic of “Income”, and one (1) meets the characteristic of “Minority, Income and English Isolation”. See the table below census block group identification number and EJ characteristics.

EJ Population Characteristics 1 and 5 Miles from A1/B2 Lines¹⁸

Distance from Project	Municipality	Census Tract	Category	Minority Population %	Median Income	% Language Isolation
1 Mile	Athol	Block Group 1, Census Tract 7033	Income	3.5	\$42,292: this is 49.3 % of the MA median.	1.2
		Block Group 2, Census Tract 7031	Income	5.5	\$43,938: this is 51.2 % of the MA median.	1.8
		Block Group 1, Census Tract 7031	Income	8.4	\$35,556: this is 41.4 % of the MA median.	2.3
		Block Group 3, Census Tract 7032	Minority	33.4	0\$	0.0
5 Mile	Clinton	Block Group 3, Census Tract 7163	Minority and Income	51.3	\$46,534: this is 54.2 % of the MA median.	8.6
		Block Group 2, Census Tract 7161	Minority and Income	38.2	\$55,536: this is 64.7 % of the MA median.	0.0
		Block Group 3, Census Tract 7161	Minority	36.6	0\$	0.0
		Block Group 2, Census Tract 7162	Minority and Income	25.5	\$42,900: this is 50.0 % of the MA median.	7.8
1 Mile	Fitchburg	Block Group 2, Census Tract 7103	Minority	27.5	\$62,353: this is 72.6 % of the MA median.	1.5

¹⁸ Data was obtained from <https://www.mass.gov/info-details/massgis-data-2020-us-census-environmental-justice-populations>

5 Mile	Fitchburg	Block Group 3, Census Tract 7105	Minority and Income	35.1	\$50,163: this is 58.4 % of the MA median.	4.1

- B. Identify all languages identified in the “Languages Spoken in Massachusetts” tab of the EJ Maps Viewer as spoken by 5 percent or more of the EJ population who also identify as not speaking English “very well.” The languages should be identified for each census tract located in whole or in part within 1 mile and 5 miles of the project site, regardless of whether such census tract contains any designated EJ populations.

See the table below for all identified Census Tracts within 5 miles of the Project that have at least 5% of the Census Tract who do not speak English well. Spanish or Spanish Creole was identified as the Primary Language by 11 Census Tracts in three (3) municipalities.

Languages Spoken by at least 5% of the Census Tract Population¹⁹

Distance from Project	EJ or Non-EJ Populations	Municipality	Census Tract	Language Spoken
5 Mile	EJ and Non-EJ	Clinton	7162	Spanish or Spanish Creole: 5.7%
5 Mile	EJ	Fitchburg	7105	Spanish or Spanish Creole: 10.2%
			7106	Spanish or Spanish Creole: 9.2%
			7108	Spanish or Spanish Creole: 9.2%
			7101	Spanish or Spanish Creole: 8.6%
			7107	Spanish or Spanish Creole: 13.9%
5 Mile	EJ and Non-EJ	Fitchburg	7104	Spanish or Spanish Creole: 5.7%
1 Mile	EJ	Leominster	7092.02	Spanish or Spanish Creole: 7.7%
5 Mile	EJ and Non-EJ	Leominster	7096	Spanish or Spanish Creole: 10.1%
			7097.01	Spanish or Spanish Creole: 6.6%
5 Mile	EJ and Non-EJ	Leominster	7094	Spanish or Spanish Creole: 11.6%

¹⁹Data for languages spoken was obtained from the American Community Survey 2011-2015 5-year estimates, Table B16001.

- C. If the list of languages identified under Section I.B. has been modified with approval of the EEA EJ Director, provide a list of approved languages that the project will use to provide public involvement opportunities during the course of MEPA review. If the list has been expanded by the Proponent (without input from the EEA EJ Director), provide a list of the additional languages that will be used to provide public involvement opportunities during the course of MEPA review as required by Part II of the MEPA Public Involvement Protocol for Environmental Justice Populations (“MEPA EJ Public Involvement Protocol”). If the project is exempt from Part II of the protocol, please specify.

Not applicable.

II. Potential Effects on EJ Populations

- A. If an EJ population has been identified using the EJ Maps Viewer within 1 mile of the project site, describe the likely effects of the project (both adverse and beneficial) on the identified EJ population(s).

The Project will occur within the existing ROW, thereby minimizing adverse environmental impacts. Due to the nature of the Project, outage constraints in the region, and NEP’s efforts to reduce impacts to the natural and human environment, Project activities will be sequenced in both the mainline and tap lines. No long-term impacts on soil, bedrock, vegetation, surface water, groundwater, wetland resources or air quality will occur.

Short-term impacts related to construction are anticipated; however, through best management practices there are no anticipated adverse effects on the identified EJ populations. Refer to Section 8.3.1.1 for the anticipated temporary impacts on Air Quality, Water Quality, Land Protection and Open Space, Noise, and Traffic and the proposed mitigation.

- B. If an EJ population has been identified using the EJ Maps Viewer within 5 miles of the project site, will the project: (i) meet or exceed MEPA review thresholds under 301 CMR 11.03(8)(a)-(b) Yes No; or (ii) generate 150 or more new average daily trips (adt) of diesel vehicle traffic, excluding public transit trips, over a duration of 1 year or more. Yes No
- C. If you answered “Yes” to either question in Section II.B., describe the likely effects of the project (both adverse and beneficial) on the identified EJ population(s).

Not applicable.

III. Public Involvement Activities

- A. Provide a description of activities conducted prior to filing to promote public involvement by EJ populations, in accordance with Part II of the MEPA EJ Public Involvement Protocol. In particular:
1. If advance notification was provided under Part II.A., attach a copy of the Environmental Justice Screening Form and provide list of CBOs/tribes contacted (with dates). Copies of email correspondence can be attached in lieu of a separate list.

Refer to Appendix H.

2. State how CBOs and tribes were informed of ways to request a community meeting, and if any meeting was requested. If public meetings were held, describe any issues of concern that were raised at such meetings, and any steps taken (including modifications to the project design) to address such concerns.

Per 301 CMR 11.05(4), Advance Notification of the Project was sent via electronic mail on June 14, 2022 by BSC to all contacts on the EJ Reference List, provided by the MEPA Office on February 23, 2022.

The Advance Notification consisted of the EJ Screening Form, as provided by the MEPA Office in the Public Involvement Protocol; a copy is provided in Appendix H. Efforts were made to ensure that language in the EJ Screening Form was understandable to the reader; that is, “technical” language was replaced with layperson terms, and legalese was omitted to the extent feasible.

NEP has undertaken measures to incorporate community involvement into the MEPA process. These community engagement strategies were determined based upon existing NEP stakeholder outreach methods and community engagement strategies provided in the Public Involvement Protocol. These involvement methods were discussed and supported by the MEPA Office during a Pre-Filing Consultation held on April 7, 2022.

A public website (“www.newenglandA1B2.com”), available in Spanish and English, is available which provides details of the Project, an interactive mapper, and contact information. This website address was also provided on the EJ Screening Form along with a contact number to request information or public meetings. Additionally, NEP hosted a virtual public meeting on July 11, 2022; information pertaining to this meeting was advertised in the Athol Daily News, Sentinel & Enterprise (Fitchburg and Leominster), Gardner Magazine and The Gardner News, Winchendon Recorder, Worcester Telegram & Gazette, and the Greenfield Recorder, and was also provided to the EJ Reference list via electronic mail and to the abutters of the A1/B2 Lines within EJ Populations via mail, see Appendix H. NEP contacted the town identified that fell within the 5% or more category to ensure that the languages spoken were not limited to Spanish. Given this information, the EJ Screening Form, meeting invitation and meeting invitation advertisement were translated into Spanish. Interpretation services were provided at the public meeting. For anyone who may have additional queries about the project an email address (“info@newenglandA1B2.com”) has been provided to reach out with their concerns.

No issues were raised during the virtual public meeting.

3. If the project is exempt from Part II of the protocol, please specify.

Not applicable.

- B. Provide below (or attach) a distribution list (if different from the list in Section III.A. above) of CBOs and tribes, or other individuals or entities the Proponent intends to maintain for the notice of the MEPA Site Visit and circulation of other materials and notices during the course of MEPA review.

Refer to Appendix H.

- C. Describe (or submit as a separate document) the Proponent's plan to maintain the same level of community engagement throughout the MEPA review process, as conducted prior to filing.

NEP will maintain the distribution list of contacts from the EJ Reference List and any additional contacts that are identified during the virtual meetings and public engagement process. Contacts will receive notifications of the MEPA site visit, summaries of supplemental information submitted to the MEPA office and any other relevant notices or materials issued during the course of the MEPA review. NEP will continue to host a project website, which is available in Spanish. Repositories for hard copies of Project materials have been established at public libraries within each of the nine (9) municipalities within the Project Site in the Commonwealth of Massachusetts, which will be updated regularly as additional Project documents become available.

CERTIFICATIONS:

1. The Public Notice of Environmental Review has been/will be published in the following newspapers in accordance with 301 CMR 11.15(1):

(Name) Athol Daily News, Greenfield Recorder; Sentinel and Enterprise; Gardner News; Worcester Telegram and Gazette; The Item (Date) 9/9/2022 (All in same date)

2. This form has been circulated to Agencies and Persons in accordance with 301 CMR 11.16(2).

1.0 PROJECT OVERVIEW AND SUMMARY

1.1 INTRODUCTION

New England Power Company (“NEP”) is proposing a refurbishment of the A1 and B2 69 kilovolt (“kV”) double circuit overhead electrical utility lines (“A1/B2 Lines” or “the Lines”). The A1/B2 Lines are located within an existing Right-of-Way (“ROW”) corridor which begins at Vernon #12 Switchyard in Vernon, Vermont, crosses through a portion of New Hampshire (“NH”), enters Massachusetts (“MA”) in Warwick, and terminates at the Pratts Junction #225 Substation located in Sterling (refer to Figure 1 below). *Table 1* summarizes the approximate mileage of the entire A1/B2 ROW in each state.

Table 1: A1/B2 Lines by State

State	Municipality	Approx. Mileage
Vermont	Vernon	2.5
New Hampshire	Hinsdale and Winchester	4
Massachusetts	Warwick, Royalston, Winchendon, Gardner, Westminister, Fitchburg, Leominster, Athol and Sterling	54
		Approx. Total – 60.5

In MA, the A1/B2 Asset Condition Refurbishment Project (“A1/B2 ACR” or “the Project”) includes the complete refurbishment of the existing A1/B2 Lines, also referred to as the “mainline”, and three (3) intersecting tap lines.

1.2 PROJECT NAME AND PROPONENT

Project Name: A1/B2 Asset Condition Refurbishment Project in Massachusetts (“A1/B2 ACR Project”, the “Project” or “A1/B2 ACR”)

Project Proponent: New England Power Company (“NEP” or “the Proponent”)

1.3 PROJECT LOCATION

All Project activities in MA will be located within the municipalities of Warwick, Royalston, Athol, Winchendon, Gardner, Westminister, Fitchburg, Leominster, and Sterling. Refer to the provided Environmental Resources Map in *Appendix A*. The Project ROW is generally oriented northwest-to-southeast from Warwick to Sterling, MA. The existing A1/B2 mainline consists of two (2) 69 kV overhead electric transmission lines (“wires”) that are supported primarily on lattice towers (“structures”). The existing 69 kV tap lines consist of the existing Athol Taps 1 and 2 in Athol and Royalston, the existing Crystal Lake Tap in Gardener, and the existing East Westminister Tap in Westminister. Tap lines are comprised of wood pole structures.

Figure 1: Project Route

The A1/B2 ROW is generally 100-ft in easement width. However, in Sterling and Leominster, the A1/B2 Lines are co-located with the I135S/J136S Lines and the ROW is wider in these locations to accommodate required clearances, see *Appendix A: MEPA General Purpose Plans*. Along the Athol Tap Lines, the ROW is generally 125ft wide and the Crystal Lake Tap Line ROW is generally 100-ft wide. The East Westminster Tap is a two (2) structure Tap line located within the A1/B2 ROW. The Project ROW¹ is generally comprised of moderately level terrain, as well as steeply sloping river terraces and cliffs. Most of the upland within the maintained portion of the ROW consists of a closed-scrub and open heath communities interspersed with a herbaceous pioneering community. Where undeveloped, the vegetative community occupying the edge of the ROW is best characterized as typical southern New England transitional upland forest and forested wetland.

Adjacent land uses include agricultural, recreational, as well as commercial and residential development. The ROW crosses multiple reservoirs, rivers, ponds, as well as numerous streams and wetland systems in MA. Throughout the Project ROW there is some variation in drainage patterns, with shallow to bedrock areas creating a steep hydrologic gradient resulting with slope discharge wetland systems, but the ROW generally drains toward wetlands and streams located in the low-lying topography producing classic toe-of-slope wetlands along the Project route.

1.4 PROJECT NEED AND BENEFITS

Project Need: The A1/B2 Lines were originally constructed in 1909 and the original lattice structures remain. The Lines were reconductored in the 1920s and were reinsulated in 2004. The existing structures and wires are in need of replacement due to asset condition and aging infrastructure. In addition, the access conditions vary considerably throughout the ROW. Existing access is present in some areas, but in others,

¹ Henceforth, Project ROW refers to the Mainline and Tap Line ROWs, unless otherwise noted.

the historic access route is in need of significant repair and does not meet NEP's standard to safely support specialized equipment. As such, the Project's primary objective is to complete the required system improvements to address the poor asset condition, mitigate potential risks of electrical failure, and to provide long-term reliable delivery of electrical service and maintenance of the line. As part of the proposed refurbishment, fiber optic ground wires will replace the existing shield wire to provide high speed communications between substations.

Secondarily, the initial results of the Independent System Operator – New England ("ISO-NE") 2050 Transmission Study ("Study") support upgrading the line to 115 kV. Since the Project proposes a complete refurbishment, all new or replacement structures will be constructed at a 115 kV capacity but operated at 69 kV. Based on current Study assumptions and forecasts, renewable energy connections and customer needs will ultimately require the system to operate at the higher voltage at some point in the future. In an effort to reduce the impacts of a large-scale refurbishment on the environment, the community and its customers, NEP proposes to "future proof" the A1/B2 Lines as part of this Project constructing lines with 115 kV capacity but operating the lines at 69 kV until the additional capacity is needed.

Project Benefits: The Project will improve transmission system infrastructure and comply with comprehensive regional plans for improving electric transmission reliability in New England. Benefits of the Project include the following:

- Increased resiliency of the mainline and tap lines. By installing improved foundations, more robust structures with improved lightning protection, and higher strength conductor and OPGW, the proposed infrastructure will be better suited to withstand strong winds and storm events.
- The new overhead lines will be larger in capacity and size which will allow more electricity to flow during times of high usage, such as extreme heat events, which are anticipated to increase in frequency due to climate change.
- The installation of OPGW will allow better communication between substations, resulting in improved response time during storm-related emergencies and outages, which will increase public safety.
- Designing for future needs reduces the frequency of disturbance to wetland resource areas, rare species habitat and adjacent landowners over time by reducing the likelihood of multiple repeat projects, thereby reducing environmental impacts and costs to NEP's customers.
- The comprehensive refurbishment will have the added benefit of allowing more renewable energy resources to connect into the system. Addressing the climate change crisis requires a major expansion of renewable energy and the infrastructure necessary to support and deliver that energy. NEP is actively taking steps to ensure that its system is ready to meet this critical challenge, and refurbishing aging infrastructure helps to accomplish this goal. Although the operation on the Line will remain at 69 kV for the foreseeable future, the 115 kV capacity proposed for the Project can support higher volumes of renewable energy resources in the future.

1.5 PROJECT DESCRIPTION

The Project includes various refurbishment activities and system improvements for 711 structures and the installation of six (6) new vertical jumper switch structures along the mainline and tap lines in MA. Activities will occur within an existing ROW and all efforts will be made to minimize the need for construction activities outside the easement. Access improvements or re-establishment and construction of new access, including vegetation removal, will be required to accommodate the proposed infrastructure. The full extent of the Project is shown in *Appendix A*.

To address the poor asset condition, The Project proposes the following activities:

- Replacement of 711 structures which will entail removing the existing structure and installing a replacement structure in an adjacent location. Based on the current Project design, it is anticipated 305 of the replacement structures will be on concrete caisson foundation, due to tension on the structure. The remaining 406 will be directly embedded into the ground and will not require caisson foundations.
- Installation of six (6) new direct embed vertical jumper switch structures along the tap lines.
- Reconductoring of all circuits with 795 Aluminum-conductor steel-supported conductor (“ACSS”) and replacing existing shield wire with two (2) OPGWs. In certain situations where a replacement structure is proposed 25-ft or more from the existing structure, a temporary structure will be installed to facilitate the new structure, conductor and OPGW installations. Additionally, in approximately 30 locations, temporary structures may be required to increase the height of the conductor during construction so that construction vehicles and “live line” work (construction activities conducted while the overhead lines are energized) can occur at a safe distance from the conductor. The temporary structures will then be removed along with the existing structure.
- Realignment of approximately 5.2 miles of the A1/B2 mainline, where there is sufficient space to accommodate longer spans and fewer structures, as well as safer and more efficient construction methodologies. In this location, the mainline will be shifted approximately 41.5 ft north towards the existing I135S/J136S Lines.
- Vegetation removal to obtain a minimum horizontal clearance of 30-ft to the edge of ROW/easement under all weather conditions. On average, the existing cleared ROW is 85-ft, with the minimum cleared width being 75-ft and the maximum approximately 100-ft. The Project proposes clearing to 100-ft on the mainline and Crystal Lake Tap Line, and 125 ft on the Athol Tap Line to obtain the necessary horizontal clearance requirements.
- Construction of new and/or re-establishment of existing access roads to provide safe access for construction and the future operation and maintenance of the lines. Vegetation mowing on the ROW and tree removals will be required to accommodate construction access. Where necessary, grading and stormwater BMPs may be required to control runoff and mitigate erosion of the constructed access roads.

Additionally, due to outage constraints in the region, Project construction activities will be generally sequenced as follows:

- Vegetation Management
- Access road re-establishment/improvement
- Matting Installation
- Foundation Installation
- Installation of Pole Bases
- Installation of Pole Tops and Arms
- Installation of new conductor and OPGW on the A1 circuit
- Pulling of new conductor and OPGW on the B2 circuit
- Removal of existing structures
- Removal of temporary structures.
- ROW restoration where required

1.6 PROPOSED CONDITIONS

1.6.1. Structures

The existing Project ROW is currently used for utility activities, including existing utility structures, access roads, and active vegetation management. Structure improvements consist of replacing wood and steel

suspension structures with direct embedded engineered steel structures. Wood and steel deadend structures will be replaced with engineered steel structures on larger caisson foundations. All new and/or replacement structures will be constructed at a 115 kV capacity and operated at 69 kV until customer needs dictate the system operate at a higher voltage.

All lines will be reconducted with 795 thousand circular mils (“kcm”) ACSS 26/7 Drake conductor. The replacement and new structure height for the mainline and tap lines is approximately 93-ft above ground (110-ft direct embed structure), which is approximately twice as tall as the existing structures standing at 51-ft and 45-ft, respectively. Due to the outage constraints associated with the A1/B2 Lines, construction will occur with energized lines and utilize live line construction techniques. As such, the proposed replacement structures must be installed at a height above the existing structures that ensures worker and equipment safety.

The overhead structures currently support conductors in a triangular configuration along with one (1) shield wire at the top of the structure. The existing shield wire, which functions as lightning protection, will be replaced with two OPGWs to provide grounding and support high-speed relay and system communication requirements. This includes two (2) OPGW to be installed between the Vernon No. 12 Switchyard in Vernon, VT, and the Pratts Junction No. 225 Substation in Sterling, MA. Similarly, for the tap lines, OPGW will be installed from the Athol Tap Line to the Chestnut Hill No. 702 Substation and from the A1/B2 mainline to the Crystal Lake No. 607 Substation.

In East Westminster, the two (2) single span tap lines will be replaced with engineered steel H-Frame terminal structures on caisson foundations and reconducted with 795 kcm ACSS 26/7 Drake conductor. Six (6) new steel pole vertical jumper switch structures are proposed to be installed, one (1) in Winchendon and five (5) in Westminster. Due to the topographic constraints on the Athol Tap Line, the engineering team is evaluating the viability of installing new structures within the ROW. Reconfiguration of the existing structures may be necessary to facilitate the necessary upgrades.

1.6.2 Limit of Disturbance

Construction activities and materials will be confined to the Limit of Disturbance (LOD) as shown on the MEPA General Purpose Plans in *Appendix A*. The LOD zone represents the additional work area beyond the limits of grading which is also shown on the MEPA General Purpose Plans in *Appendix A*. Within the LOD, equipment access, the placement of temporary BMPs, soil stockpiling and equipment maneuvering is anticipated. In addition, where applicable, tree removals are preliminarily assumed within the LOD zone due to the anticipated secondary impacts from grading activities. Temporary construction matting is assumed to be utilized where access is necessary in wetlands. NEP is working toward solutions to reduce the extent of the LOD throughout the Project ROW. NEP will coordinate with landowners as necessary for temporary construction access as the plans are refined.

1.6.3. Vegetation Management

To provide a safe area for construction, future maintenance, and operation, and to ensure the reliability of the proposed lines, vegetation on the existing ROW will continue to be maintained to prevent the growth of tall woody species. In addition, to obtain the minimum horizontal clearance of 30-ft to the edge of ROW under all weather conditions, the existing cleared portion of the ROW will need to be expanded, as necessary. The existing maintained ROW on the mainline, the Crystal Lake Tap Line and the Athol Tap Line is roughly 85-ft, 75-ft, and 100-ft, respectively. To provide the necessary clearances for the replacement and new structures, the mainline and Crystal Lake Tap ROWs will be cleared to 100-ft, and the Athol Tap ROW will be cleared to 125-ft. Following the completion of construction, maintenance

activities will be consistent with the Five-Year Vegetation Management Plan (“VMP”) (2019-2023), and subsequent approved plans, presented in *Appendix D*.

1.6.4 Access Routes, Work Pads and Envelopes, and Pull Pads

1.6.4.1 Access Road Routes

Efforts were made during planning and design to align access with previously utilized roads or pathways along and adjacent to the ROW where feasible. Being among NEP’s oldest assets, access conditions vary considerably throughout the ROW, in many cases, historic access roads/paths will require significant improvement to meet the access requirements for the Project. These roads are categorized as either “Standard Road Type 1-2” or “Designed Road Type 3-5” which includes the refurbishment of an existing access road, and Designed Road Type 3-5, which ranges from an entirely new road to a complete reconstruction of an existing access road. Unless otherwise noted on the MEPA General Purpose Plans presented in *Appendix A*, work pads/envelopes and pull pads will be graded and stoned as necessary to establish a level access.

Where existing access does not exist along the ROW, new access is proposed and categorized as either Standard Road Type 1-2 or Designed Road Type 3-5. New access in upland areas is assumed to include import, placement, and compaction of gravel to create a new road to access structures for construction. Standard Road Type 1-2, access roads include upland areas where the terrain is relatively level and will not require significant cut/fill to construct. In these areas, if required, soft surface material (e.g., topsoil) will be stripped and replaced with suitable gravel to provide a stable road base. If existing surface material is suitable as a base (e.g., sand/gravel), imported gravel will be placed without stripping existing surface material. Standard access roads may include stormwater Best Management Practices (“BMPs”) to control runoff and mitigate erosion of the constructed access roads.

Designed Road Type 3-5, access roads are proposed where the existing terrain is steeper and will in-turn require additional cut/fill to construct. The limit of cut/fill associated with designed access roads is shown on the attached MEPA General Purpose Plans in *Appendix A*. In addition, designed roads include stormwater BMPs to control runoff and mitigate erosion of the constructed roads and/or adjacent slopes.

Stormwater BMPs such as swales, stone check dams, water bars, or other similar measures will be installed as necessary based on the access road design. These measures are intended to reduce adverse impacts from stormwater flows, maintain the longevity of the roads, and reduce overall maintenance needs. New access roads were sited within the existing ROW easement to the extent feasible; however, due to existing site constraints (e.g., steep slopes, rocky outcrops, proximity to wetland resource areas), some access routes are sited beyond the existing easement boundaries see MEPA General Purpose Plans in *Appendix A*. All new access roads (including those which extend beyond the existing easement) will be maintained by NEP.

1.6.4.2 Work Pads/Envelopes and Pull Pads

Work envelopes will be placed at all structures where work is proposed. Pull pads are required where reconductoring and OPGW pulling activities are proposed (see *Appendix A: MEPA General Purpose Plans*). Within wetlands and agricultural fields, construction matting will be utilized to provide a safe work area. In the remaining upland work areas, stone work pads will be constructed. In general, the work envelopes have been designed to be up to approximately 157-ft by 80 to 100-ft depending on the width of the ROW and extent of grading required to create the level work area and provide adequate space for the typical live line construction associated with the Project’s scope of work. Similarly, pull pads may require grading or temporary construction mats in specific locations to support pulling of conductors and/or OPGW.

Work envelopes will be constructed to provide a stable and safe work area to conduct the proposed Project. Permanent work pad construction is proposed predominantly in upland areas (i.e., beyond the limits of Bordering Vegetated Wetland “BVW”). Given the steep and rocky terrain to effectively establish work envelopes at several of the structures extensive grading and establishment of retaining walls will be required in select locations. As shown in *Appendix A*, temporary work envelopes formed from construction matting will be utilized to the maximum extent practicable in wetland resource areas.

1.6.4.3 Retaining Walls

The majority of the proposed access road improvements, temporary pulling pads, and permanent gravel work pads will be constructed by cutting and/or filling existing grade as required to meet the design grade. However, there are several field conditions identified during design that warrant use of a retaining wall. The current design proposes retaining walls in the municipalities of Winchester, Warwick, Royalston, Winchendon, Gardner, Westminster, Fitchburg, Leominster, and Athol (See MEPA General Purpose Plans on *Appendix A*). These walls are proposed to protect existing structures and/or features, as well as adjacent wetland resource areas, in areas where permanent work pads are required. Similarly, retaining walls are proposed along the limits of the ROW in areas where surface grading would encroach on abutting properties. This is especially critical in areas of state forests and other recreational lands.

The following types of retaining wall were considered to be appropriate for use on this Project. During construction, a retaining wall type will be selected based on local geotechnical conditions and other site constraints.

- Gabion Basket Retaining Wall (permanent installation)
- Large Block Gravity Retaining Wall (permanent installation)
- Mechanically Stabilized Earth (“MSE”) Retaining Wall (permanent installation)
- Sheet Pile Retaining Wall (temporary/permanent installation)
- Construction Mat Retaining Wall (temporary installation)

1.7 SUMMARY OF IMPACTS

Table 2: Summary of A1/B2 Transmission Lines Refurbishment Impacts presents an overview of the impacts anticipated to result from the Project. As an active ROW, the Project area is already disturbed and maintained.

Table 2: Summary of A1/B2 Transmission Lines Refurbishment Impacts²

Resource Area	Temporary Impacts	Permanent Impacts ³
New Land Altered: <i>See Section 3: Land Use</i>	No temporary impacts	Total permanent impact – approximately 216 acres <ul style="list-style-type: none"> • <i>Tree removal approximately 164 acres</i> • <i>New/improved access approximately 52 acres⁴</i>

² Note that impacts located within the limits of Riverfront Area overlap with impacts to BLSF, BVW, and the 100-foot Buffer Zone. Therefore, the total impacts to the Project Site are not equal to the sum of alterations.

³ Work envelopes will consist of temporary construction matting within BVW and BLSF and will consist of gravel elsewhere. Where BVW and BLSF overlap with Riverfront Area, these impacts will be temporary; otherwise, work envelope construction will be permanent.

⁴ Calculated at a 12-ft wide travel lane.

Resource Area	Temporary Impacts	Permanent Impacts ³
Bordering Vegetated Wetland (“BVW”) See Section 4: Wetlands and Wildlife	Total Temporary – <i>approximately 2,200,651 sf (51 acres)</i> ⁵ <ul style="list-style-type: none"> • <i>Construction mats for access roads where BVW crossings could not be avoided.</i> • <i>Construction mats for construction work envelopes and pull pad work envelopes that overlap with BVW.</i> • <i>Construction mats within Limit of Disturbance only</i>⁶ 	Total Permanent – <i>approximately 667,928 sf (15 acres)</i> <ul style="list-style-type: none"> • <i>Fill for replacement structure foundations in BVW</i> • <i>Tree removal will result in conversion of PFO to PSS</i>
Other Wetland Resource Areas See Section 4: Wetlands and Wildlife		
Inland Bank (“Bank”)	Total Temporary – <i>approximately 67,954 sf</i> <ul style="list-style-type: none"> • <i>Construction mats where access roads cross Bank.</i>⁷ 	Total Permanent – <i>approximately 26,572 sf</i> <ul style="list-style-type: none"> • <i>Selective tree pruning over portions of Bank that are currently forested.</i>⁸
Riverfront Area (“RA”)	Total Temporary – <i>approximately 513,137 sf (12 acres)</i> <ul style="list-style-type: none"> • <i>Approved VMP activities only (mowing)</i> • <i>Construction mats for access roads, work pads and pull pad envelopes where RA overlaps with BVW, residential lawn or agricultural land.</i> 	Total Permanent— <i>approximately 2,101,679 sf (48 acres)</i> <ul style="list-style-type: none"> • <i>New/or replacement structure foundations</i> • <i>Cut/fill for access roads, work envelopes, pull pads and retaining walls as identified on the MEPA General Purpose Plans</i> • <i>New/improved access roads</i> • <i>Stabilization material in improved/expanded sections of existing access roads.</i> • <i>Tree removal</i>
Bordering Land Subject to Flooding (“BLSF”)⁹	Total Temporary— <i>approximately 13,939 sf</i> <ul style="list-style-type: none"> • <i>Approved VMP activities only (mowing)</i> • <i>Construction mats for access roads, work pads and pull pad envelopes where BLFS overlaps with residential lawn or agricultural land.</i> 	Total Permanent— <i>approximately: 389,517 sf and 76.6 cubic yards (“cy”) fill</i> <ul style="list-style-type: none"> • <i>Fill for structure foundations</i> • <i>Cut/fill for work envelopes, pull pads and access roads. Areas will be over-excavated so that no loss in flood storage occurs.</i> • <i>Tree removal</i>

5 Approximately 122 acres of BVW total in Project.

6 20-ft Limit of Disturbance is utilized for Project impacts as described above, except where retaining walls are constructed and the Limit of Disturbance is 10-ft.

7 In most cases, construction mat crossing will span the Bank of rivers and stream; however, the potential for alteration has been accounted for in the Project impact calculations.

8 Includes canopy removal for vegetation clearance for the overhead line and tree removals within the Limit of Disturbance

9 as identified on the MEPA General Purpose Plans. Work areas will be graded such that no flood storage is displaced. (~293,924 sf)

Resource Area	Temporary Impacts	Permanent Impacts³
Land Under Water (“LUW”)	Total Temporary– <i>approximately 32,206 sf</i> <ul style="list-style-type: none"> • <i>Construction mats for access roads, work pads and pull pad envelopes where spanning open water was not feasible.</i> 	Total Permanent – <i>approximately 158 sf</i> <ul style="list-style-type: none"> • <i>Fill for two (2) new/or replacement structure foundations</i>
Isolated Wetland	Total Temporary – <i>approximately 73,181 sf (~1 acres)</i> <ul style="list-style-type: none"> • <i>Approved VMP activities only (mowing)</i> • <i>Construction mats for access roads, work envelopes, and pull pad work envelopes that overlap with Isolated Wetlands.</i> 	Total Permanent - <i>approximately 11,840 sf</i> <ul style="list-style-type: none"> • <i>Fill for new/or replacement structure foundations in Isolated Wetlands</i> • <i>Tree removal will result in conversion of PFO to PSS.</i>
Resource Area	Impacts	
Waterways	Two (2) concrete foundations are proposed within a waterway along the Crystal Lake Tap in Gardner, MA. Temporary and permanent impacts to LUW are anticipated, see above. Waterways crossings do not involve structures within the waterways, and they will be designed to allow unimpeded access by foreseeable watercraft. No adverse impacts are anticipated from waterways crossings.	
Rare Species Impacts <i>See Section 5: Rare Species</i>	Rare Species may have potential impacts where construction-related activities occur within designated habitat. A “take” has the potential to occur due to road improvement activities; consultations with Natural Heritage and Endangered Species Program (“NHESP”) are in progress to identify areas of concern, and to identify appropriate avoidance measures, which will be implemented, as required.	
Historical/ Archaeological Impacts <i>See Section 6: Historic and Archaeological Resources</i>	Historical/ Archaeological areas may have potential impacts where construction-related activities occur within areas of high archaeological sensitivity. Surveys are ongoing by SWCA Environmental Consultants to identify areas of concern, and to identify appropriate avoidance measures, which will be implemented, as required.	

1.8 SUMMARY OF MITIGATION

NEP follows a set of policies for ROW access, maintenance, and construction BMPs. By consistently implementing these procedures, NEP ensures that transmission lines are maintained and constructed by trained personnel in a manner that minimizes potential impacts to the environment, adheres to permit conditions, and meets industry standards. Key elements of the construction policy include pre-construction field investigations, field inspections during construction, and post-construction inspections.

Throughout construction, appropriate consideration will be given to Project implementation in a manner consistent with conditions of permits/authorizations and approved mitigation measures. (*See Section 12 and*

Appendix C). To minimize Project impacts, NEP has incorporated the following actions and considerations throughout the planning and design phases:

Several asset condition and reliability needs were combined into one Project scope in an effort to reduce the need for repeat disturbances to wetlands, other environmental resource areas and adjacent property owners in this shared ROW:

- Existing ROW and access roads are being used to avoid new land disturbance, where feasible;
- Field investigations were completed to assess constructability and avoid/mitigate sensitive resources;
- Agency consultations are in progress;
- Replacement structures are being located outside of BVW where feasible;
- Temporary construction mat BMPs will be utilized to minimize wetland impacts; and
- Work areas within wetlands will be temporary only; no permanent fill within wetlands is proposed for access, work envelopes or pull pads.

Additional mitigation measures are discussed in *Sections 3 through 11* of this Project Narrative and summarized in *Section 12: Mitigation Overview and Section 61 Findings*. Additional mitigation measures will be implemented as required by state, federal and local requirements. NEP anticipates that the final mitigation package will be developed during the federal, state and local permitting processes outlined in the next section, and that the package will fully address the required permit conditions and agency concerns. NEP anticipates that mitigation will demonstrate no net loss of existing wetland functions, values, and statutory interests within the watershed.

1.9 PROJECT ALTERNATIVES

Several project alternatives were analyzed and eliminated as they did not meet the Project needs. See *Section 2: Alternatives Analysis* for project alternatives.

1.10 PROJECT PERMITTING REQUIREMENTS

NEP will obtain all approvals and permits required by federal, state, and local agencies for the Project, and the Project will be constructed and operated to comply fully with state and local environmental policies (*See Section 11: Regulatory Compliance*). The Project will contribute to a reliable, low cost, diverse energy supply for the Commonwealth with minimal environmental impact. *Table 3: Permit/Consultation Requirements* summarizes the federal, state, and local permits and approvals required or potentially required for the Project in Massachusetts.

Table 3: Permit/Consultation Requirements

Agency	Permit/Review/Approval
Federal	
U.S. Army Corps of Engineers (“USACE”)	Section 404 PCN Permit and consultations under Section 106 of National Historic Preservation Act and Section 7 of the Endangered Species Act
United States Environmental Protection Agency (“EPA”)	National Pollutant Discharge Elimination System (“NPDES”) General Permit for Stormwater Discharges and Construction Dewatering Activities/Stormwater Pollution Prevention Plan (“SWPPP”)
State	
Executive Office of Energy and Environmental Affairs (“EEA”)	MEPA Review/ Certificate of the Secretary
Massachusetts Department of Environmental Protection (“MassDEP”)	Section 401 Individual Water Quality Certificate and Variance
Massachusetts Natural Heritage and Endangered Species Program (“NHESP”)	Massachusetts Endangered Species Act – Determination of Take or No Take; Conservation Permit (if needed)
Massachusetts Historical Commission (“MHC”)	Consultation under M.G.L. c. 9 in accordance with 950 CMR 70-71
Energy Facilities Siting Board (“EFSB”) ¹⁰	G.L. c. 164, §69J Petition for Approval to Construct Transmission Lines
Massachusetts Department of Public Utilities (“DPU”)	G.L. c. 164, §72 Petition for Determination of Public Necessity and Convenience
Department of Conservation and Recreation (“DCR”)	Construction Access Permit
Massachusetts Department of Transportation (“MassDOT”)	Permit to Access State Highway/Non-Municipal Utility Permits for crossing over of state roads with utility lines.
Local	
Conservation Commissions in Athol, Fitchburg, Gardner, Leominster, Royalston, Sterling, Warwick, Westminster, and Winchendon	Order of Conditions per the Massachusetts Wetlands Protection Act (“MA WPA”) ¹¹ and local bylaws.
Fitchburg Commissioner of Public Works	Stormwater Permit
Fitchburg Tree Warden	Tree trimming/Removal Permit
Gardner Zoning Board of Appeals	Special Permit – Earthmoving & earth alteration
Royalston Conservation Commission	Stormwater Management Permit

10 Concurrently with its Petition to the Siting Board, NEP intends to file Petitions with the Department of Public Utilities (DPU) in accordance with G.L. c. 164, § 72 and requesting exemptions from the Zoning Ordinances of the communities pursuant to G.L. c. 40A, § 3, other than those noted above.

11 MA WPA Orders of Conditions are local permits unless and until a superseding Order of Conditions is issued by MassDEP.

Royalston Board of Selectmen	Written Permission for soil removal activities
Sterling Conservation Commission	Stormwater Management Permit
Sterling Zoning Board of Appeals	Earth Removal Permit
Westminster Zoning Board of Appeals	Earth Removal Permit
Winchendon Zoning Board of Appeals	Earth Removal Permit

1.11 CONSTRUCTION METHODS AND PROJECT SCHEDULE

Overall, NEP strives to design and implement projects to avoid or minimize adverse environmental impacts to the extent practicable. Where impact is unavoidable, minimization and mitigation techniques are employed. As such, NEP has developed procedures and policies to guide the professionals who plan and oversee implementation of Project construction. NEP’s construction methods are summarized in *Section 10: General Transmission Line Construction Procedures*; please also refer to *Appendix C: National Grid Environmental Guidance Document (“EG-303NE”)* for additional information on the general procedures and policies implemented during construction to identify and control environmental impacts.

NEP anticipates starting construction in 2025 which is anticipated to last at least a minimum of three years.

1.12 MEPA JURISDICTION

The Project is subject to MEPA review as it requires one or more state permits and exceeds the thresholds listed in *Table 4: MEPA Thresholds*.

Table 4: MEPA Thresholds

<u>MEPA EIR Threshold</u>
EIR: Land: <i>Direct alteration of 50 or more acres of land, unless the Project is consistent with an approved conservation farm plan or forest cutting plan or other similar generally accepted agricultural or forestry practices. (301 CMR 11.03(1)(a))</i>
EIR: Wetlands, Waterways and Tidelands: <i>Alteration of one or more acres of bordering vegetated wetlands (“BVW”). (301 CMR 11.03(3)(a)(1)(a))</i>
EIR: Wetlands, Waterways and Tidelands: <i>Alteration of ten or more acres of any other wetlands. (301 CMR 11.03(3)(a)(1)(b))</i>
EIR: Environmental Justice: <i>The Secretary shall require an EIR for any Project that is located within a Designated Geographic Area around an Environmental Justice Population. (301 CMR 11.06(7)(b))</i>
<u>MEPA ENF Thresholds</u>
ENF: Wetlands, Waterways and Tidelands: <i>Alteration of 500 or more linear feet of bank along a fish run or inland bank. (301 CMR 11.03(3)(b)(1)(b))¹²</i>
ENF: Wetlands, Waterways and Tidelands: <i>Alteration of one half or more acres of any other wetlands. (301 CMR 11.03(3)(b)(1)(f))</i>
ENF: Rare Species: <i>Taking of an endangered or threatened species or species of special concern, provided that the Project site is two or more acres and includes an area mapped as a Priority Site of Rare Species Habitats and Exemplary Natural Communities. (301 CMR 11.03(2)(b)(2)). (Potential-ongoing consultations.)</i>

This Expanded Environmental Notification Form (“EENF”) is being filed in accordance with 301 CMR 11.05(7) to provide more extensive and detailed information as part of a request for submission of a Single EIR, in accordance with 301 CMR 11.06(8).

The EENF Form included with this submission addresses all potential impacts of the Project. This narrative supplements the EENF Form and provides additional detailed information on those aspects of the Project that have the potential to adversely affect the environment and that are within the subject matter jurisdiction of the required or potentially required state permits:

- Land Use
- Wetlands and Wildlife
- Rare Species
- Historical and Archaeological Resources
- Environmental Justice Populations.

To the extent that the Secretary determines that the Scope should include additional information, we request that the information be addressed in the Single EIR.

¹² In most cases, construction mat crossing will span the Bank of rivers and stream; however, the potential for alteration has been accounted for in the review of MEPA Thresholds.

1.13 SINGLE EIR OPTION

The Project exceeds the MEPA EIR threshold for Land alteration, BVW alteration, and is located within a designated geographic area around an EJ population. NEP respectfully requests that MEPA allow a Single EIR filing.

2.0 ALTERNATIVES ANALYSIS

2.1 INTRODUCTION

As noted in *Section 1*, this Project consists of refurbishment activities on the existing 69 kV Transmission Line along an existing ROW. NEP's overriding goal throughout the planning and design phases of the Project has been to select the alternative that best (A) meets the identified Project need and reliability, (B) addresses the various regulatory and permitting objectives, (C) including minimizing environmental impacts, and D) provides a cost-effective solution to customers. Several alternatives were evaluated. This alternative analysis presents a No Build Alternative and options for selective/targeted maintenance and improvements. None of the alternatives to the Project are feasible and meet the identified needs.

2.2 NO BUILD ALTERNATIVE

As required by 301 CMR 11.07(6)(f)(2), a No Build Alternative must be evaluated to establish a baseline against which the Project can be evaluated. However, in this instance, the No Build Alternative does not achieve the Project's goals and benefits.

This Project consists of refurbishment activities to existing assets. If no action is taken, deteriorating structures will pose a safety risk to NEP personnel and will affect NEP's ability to provide reliable electrical services to members of the public. Given the condition of the existing circuits and the need to provide high speed communications between the substations these circuits serve, this option was not pursued.

In summary, under the No-Build Alternative, the electric supply system in the region, would not comply with national and regional reliability standards and criteria. Given the asset condition of the existing circuits and pole deterioration, the no build alternative would leave the transmission system at risk resulting in severe reliability issues. Additionally, the no-build alternative does not satisfy the need to provide high speed communications between the substations these circuits serve. Therefore, the No-Build Alternative is not considered to be a feasible option.

2.3 CRITICAL ASSET REPAIR ALTERNATIVE

A critical asset repair alternative was considered to address only the most critical asset related issues. However, this would require returning to the A1/B2 Lines repeatedly to complete less critical maintenance and improvement activities. This would result in repeated access and temporary impacts including temporary construction matting, within Public Open Space and Recreational Areas, adjacent Watershed Areas, BVW and other environmental resources and rare species habitat. Additionally, this alternative would not address the quantity of asset condition concerns, would not improve the reliability of existing communications between the substations served by the circuits, and would result in inefficiencies in revisiting the same ROW within a short time span. This alternative was deemed infeasible and not analyzed further.

2.4 69 kV REBUILD ALTERNATIVE

As stated in *Section 1.4*, future proofing the Lines with a 115 kV carrying capacity allows NEP to minimize the likelihood of repeat impacts to adjacent landowners and environmentally sensitive areas as customer and renewable energy needs continue to grow in the region. Refurbishing the Lines to operate with a 69 kV carrying capacity would not meet the identified need and therefore, was not considered a feasible alternative.

Additionally, due to the outage constraints of the A1/B2 Lines, the Project would need to utilize live line construction techniques. As such, the proposed replacement structures would need to be installed at a height above the existing structures, regardless of proposed voltage. Should the existing structures be replaced to

meet 69 kV standards, this would only result in a decrease of approximately 5.5-ft in structure height from those proposed. Therefore, the height standards for the required minimum horizontal clearance requirements would be the same at 69 kV as they are for the proposed 115 kV, and tree removal requirements on ROW would not be reduced. Refurbishing the Lines at 69 kV would not reduce environmental impacts and would not provide the benefit of operating the Lines at 115 kV in the future.

2.5 115 kV STRUCTURE DESIGN ALTERNATIVES

Double-circuit davit arms structures are proposed for the mainline and single-circuit davit arm structures are proposed for the tap lines. However, NEP evaluated alternative structures for both. In summary, for the A1/B2 mainline, alternative structure type, davit arm length and installation method were evaluated and excluded as infeasible due to increased footprint, ice jump condition¹³, soil conditions and safe clearance distance, respectively. For the tap lines, alternative structure types were evaluated and excluded due to outage constraints, reliability concerns, and limiting risk of tree contact, respectively. The alternative structures evaluated, and the reason why the alternative was not selected and is not further analyzed, is given below in *Table 5*.

Table 5: 115 kV Structure Design Alternative Evaluated and Reasons for Elimination

	Alternative	Reasons for Elimination
Mainline	Two single circuit structures	Two single circuit structures were eliminated as the design for the mainline as it would have required an increase in work footprint, additional concrete caisson foundations, and doubled the number of steel poles required.
	7-ft Davit Arm	A 7-ft davit arm was evaluated and rejected for use along the mainline structures. This is due to the findings of the ice jumping study, which identified that a 10-ft middle davit arm is required to maintain adequate clearance during ice-shedding.
	Direct embed all structures	Direct embed structures were evaluated for all locations along the mainline. However, due to wide range of soil conditions on the ROW, the direct embed method will not be feasible at all locations. Where possible, structures will be direct embedded 10% of their height plus 6-ft. Where soil conditions do not support direct embed structures, concrete caissons will be utilized.
	Light Duty Steel Poles	Due to the proximity of the proposed A1 structure to the existing B2 line, the diameter of light duty poles would not maintain safe clearance distance.
Athol Tap	Delta davit arm configuration structures	<p>The Athol Tap #2 Line was first proposed as delta configuration structures since the line is being rebuilt in place and will allow this type. This scope was changed to a vertical configuration to match the structures on the Athol #1 Tap.</p> <p>Reliability of inward facing circuits are believed to be better than delta by limiting risk of tree contact.</p> <p>2 single circuit H-frames would require 150-ft of ROW width vs the proposed 125-ft total.</p>

¹³ The maximum jump height of a transmission line after ice-shedding. Ice-shedding from conductors can cause significant vertical vibration of the transmission line.

		<p>Vertical: both circuits will be the same height, better visually, would require taller structures and caisson foundations.</p> <p>Delta: Structures are shorter, but less visually pleasing. If skipping structures, direct embed foundations may be similar in cost to caisson foundations.</p>
Athol and Crystal Lake Tap Lines	Double circuit structures	Because of reliability concerns associated with having both tap lines on the same structure, it was preferred to install single circuit structures.

2.6 PREFERRED ALTERNATIVE: COMPREHENSIVE REFURBISHMENT (THE PROJECT)

The Preferred Alternative, as described in *Section 1.5*, proposes various refurbishment activities and system improvements for 711 structures and the installation of six (6) new vertical jumper switch structures along the mainline and tap lines in MA. Access improvements or re-establishment and construction of new access, vegetation removal and the installation of OPGW is also proposed. Providing an efficient means of addressing asset condition concerns, replacing the deteriorating structures, and allowing high speed communications between substations, addresses the need without repeat impacts to wetland resource areas, rare species habitat, and adjacent homeowners. Therefore, this full-scale refurbishment meets all project objectives and reduces long term environmental impacts.

2.7 CONCLUSION

As described above, NEP analyzed the ability of several project alternatives to meet the identified needs. The No Build Alternative was rejected because it would not meet the identified need of addressing asset reliability and repair requirements. The Critical Asset Repair Alternative and the 69 kV Alternative would require supplemental projects (with additional environmental impacts) to adequately reinforce the A1/B2 Lines over the next decade. Access alone would result in approximately 49 acres of repeat temporary impacts to the same BVWs for each additional mobilization due to temporary construction matting. As such, the Project will best address the identified needs with the least impact to the natural and human environment.

3.0 LAND USE

3.1 INTRODUCTION

This section provides a description of existing land use along the Project ROW, as well as potential impacts and proposed mitigation measures associated with land alteration along the Project route. Existing conditions information for land use was obtained using MassGIS Standardized Assessors’ Parcel Use Codes for each community.

The MEPA General Purpose Plans in *Appendix A* depict areas of proposed land alteration (e.g., structure locations, access roads, work envelopes, tree removals, etc.) associated with the Project.

3.2 EXISTING CONDITIONS

3.2.1 Land Use

The land area of the Project ROW is approximately 844.4 acres. Using current MassGIS data layers, land use characteristics were evaluated for the existing ROW and a 300-ft buffer on either side of the ROW.

Land use within the ROW and adjacent uses within 300-ft of the ROW edge consists of predominantly Exempt Property¹⁴, with Residential being the second most common parcel designation. Because this Project is a refurbishment of an existing transmission line, area residents and businesses will benefit directly from the upgrades through increased system reliability. The land within the ROW has been actively utilized and maintained as a transmission line corridor since the 1910s. *Table 6* summarizes the MassGIS land use information for the ROW and adjacent uses within 300-ft of the ROW edge.

Table 6: Land Use

Land Use				
Land Use Type	Acres Within ROW	% Within ROW	Acres Within 300ft Buffer	% Within 300ft Buffer
Mixed Use	66.32	7.85%	264.08	5.89
Residential	234.62	27.79%	1434.17	31.96
Commercial	3.37	0.40%	43.33	0.97
Industrial	82.41	9.76%	349.90	7.80
Forest Property	32.21	3.81%	227.00	5.06
Agricultural/ Horticultural	2.01	0.24%	21.31	0.47
Recreational Property	1.47	0.17%	9.90	0.22
Exempt Property	391.65	46.38%	1933.12	43.08
Unknown	5.05	0.60%	19.31	0.43
Transportation	20.11	2.38%	143.48	3.20
Water	5.18	0.61%	41.66	0.93
Total	844.41		4354.73	

Source: [MassGIS \(Bureau of Geographic Information\)](#), June 2022. Used 2020/2021/2022 parcel data from each town and used their use codes as land use type. Percent rounded to closest 100th.

Exempt Property constitutes 46.38% within the ROW and 43.08% within the 300-ft buffer. This category of land use includes federal, state, and local land (municipal and authorities); charitable (hospitals, cemeteries); religious organizations (churches); and educational institutions. For this Project, Exempt

¹⁴ Exempt Property are properties that qualify from exemption from taxation under various provisions of the law and include public land and facilities, hospitals, schools, churches and cultural institutions, M.G.L. Chp. 59 §5.

Property is found along the ROW where the municipalities own most of the property. The DCR owns large acres of land around Leominster, Royalston, and Winchendon that fall within the 300-ft buffer. These lands comprise acres of state forests including Royalston State Forest, Warwick State Forest, Leominster State Forest, and Otter River State Forest. The Town of Leominster owns reservoirs and conservation lands that fall within the 300-ft buffer. Other Exempt Property includes conservation land such as Bailey Brook Conservation Area in the City of Gardner, Minnie French Conservation Area in Town of Athol, Nashua Valley, Elm Street and Hill Street Conservation Area in the City of Leominster, and Shenk Farm Conservation Area in the Town of Westminster. The U.S. Fish and Wildlife Service has Exempt Property in the municipalities of Athol, Royalston, and Westminster. Mount Wachusett Community College property is within a half mile buffer of the ROW, and the parking lot of the college is within 300-ft buffer in the City of Gardner.

Residential land use comprises just over 27% of the ROW, and approximately 32% of the 300-ft buffer. After Residential land use, the next highest category of land use is Industrial land use. Industrial land use comprises 9.76% of the ROW, and 7.80% within the 300-ft buffer.

After Residential and Industrial land uses, the next highest category of use is “Mixed Use”. Mixed use constitutes over 7.85% of the ROW and 5.89% of the 300-ft buffer. These land uses are concentrated where the transmission ROW crosses major highways and primary roads. The Transportation category constitutes about 5.5% of the land use in the study area and includes highway and railroad corridors. These include State Highway Route 2, Massachusetts Bay Transportation Authority (“MBTA”), Fitchburg Railway, and DOT roads.

3.2.2. Sensitive Receptors

The 300-ft study buffer contains three (3) sensitive receptors – a fire station, a police station, and recreational land¹⁵. The town of Royalston has a police station and a fire station, located in the same building, within the 300-ft buffer. The distance from the edge of the stations to the 300-ft buffer is approximately 55-ft. The recreational land within the 300-ft buffer is located along Mellen Road, Winchendon. In addition, the Mount Wachusett Community College property parcel is located within the 300-ft buffer. The distance from the edge of the college parking lot to the edge of the ROW is approximately 150-ft. However, there are no Mount Wachusett Community College buildings within the 300-ft buffer.

3.2.3 Public Open Space

Public open space resources adjacent to the Project are listed in *Table 7*. The primary purposes of these protected lands include state parks and recreation, conservation, and habitat protection. Many of these areas provide year-round recreational opportunities such as hiking and nature study, and seasonal activities such as fishing. The majority of the open space areas located adjacent to the Project ROW provide scenic views and are often associated with rivers, reservoirs, wetlands, streams, rivers, and state forests.

Table 7: Open Space and Recreation Resources

3.3 LAND USE IMPACTS

As detailed in *Sections 1 and 2*, the proposed Project was selected to meet the identified refurbishment needs and minimize permanent impacts to environmental resources without repeat impacts to wetland resource areas, rare species habitat, and public open space. The majority of new land alteration will occur as a result of the construction of new access roads and the modification of previously existing access roads as necessary to facilitate the refurbishment effort and required tree removals to obtain required horizontal clearances from the edge of ROW under all weather conditions. This will result in approximately 216 acres of permanent disturbance. Within reason, the use of existing access roads and routes has been prioritized so as to reduce new alterations.

Proposed work includes refurbishment activities and system improvements for 711 structures and the installation of six (6) new direct embed vertical jumper switch structures along the mainline and tap lines in MA. Additional refurbishment work includes the installation of new conductor, insulators and associated hardware, and installation of OPGW along the entire length of the Project. Concrete caisson foundations will be installed at 305 structure locations; the remaining 406 structures will be installed via direct embed methods.

The means and methods of construction resulting in potential impacts and alterations is detailed in the sections below. The ROW and the existing access routes have been previously disturbed due to normal utility activities. Construction and operation of transmission lines and tap lines along the Project route will not conflict with or impact the use or accessibility of adjacent open space and recreational land, primarily because the proposed transmission lines will be located within an existing ROW.

3.3.1 DCR Property

The A1/B2 Lines, cross four (4) DCR Properties, the Leominster State Forest in Leominster and Fitchburg, the Royalston State Forest in Royalston, the Otter River State Forest in Royalston and Winchendon, and the Warwick State Forest in Warwick. NEP's easements for the A1/B2 Lines in these areas predate the establishment of DCR properties and state forests. *Table 8*, below, describes the parcel, structure segments and ROW area in each property. On ROW, these properties account for 78.54 acres of land, approximately 9.3% of the Project area.¹⁷ NEP has initiated discussions with DCR.

¹⁷ Land Use Code 900, 901, 910, 920V classified as Article 97 State Property.

Table 8: Project Areas within DCR Property

Property	Municipality	Parcel Number	ROW Segment ¹⁸	ROW Acreage ¹⁹
Leominster State Forest	Fitchburg	S53 10 0	543 to 540	3.03
	Leominster	458 6	554 to 555	1.09
		458 7 A	553	1.09
		119R 7 A	555 to 550-2	3.84
Royalston State Forest	Royalston	10-50	249 to 248;	1.66
		6-2	248 to 237-1	3.92
Otter River State Forest	Royalston	15-31	323-1 to 316	6.14
		15-27	315 to 313	2.29
	Winchendon	10 0 3	325-1 to 323-1	0.78
		10 0 47	347 (south)	0.23
		10 0 48	347 to 346E	3.21
		N/A	347 (north)	0.32
		10 0 51	349 to 348	1.22
Warwick State Forest	Warwick	312/404.0-0000-0029.0	191 to 186	4.15
		312/404.0-0000-0026.0	186 to 177	8.48
		312/404.0-0000-0015.0	177-159	16.51
		312/403.0-0000-0001.0	159 to 149	13.96
		312/401.0-0000-0024.0	128 to 122	4.91
		312/401.0-0000-0019.0	119 to 114	4.96

These areas offer opportunities of recreational activities to local residents and visitors. Several multi-use trails intersect the existing ROW. DCR trails vary in type from Forest Roads and Trails with natural surfaces to processed gravel, varying in width and condition. The Project has been designed to utilize existing access within NEP easements wherever feasible; however, coordination with DCR will be required for improving existing access and constructing new access roads within State Forest lands. As is discussed in more detail in *Section 3.3.3.1.1* below, due to the complex, steep, and rocky terrain, proposed access routes were selected based on historic use, constructability, feasibility, and safety.

¹⁸ Structure numbers refer to existing number.

¹⁹ Rounded to the nearest 100th.

3.3.2 Vegetation Removal/Maintenance

To obtain the minimum horizontal clearance of 30-ft to the edge of ROW under all weather conditions, the existing maintained portion of the ROW will need to be expanded, as necessary. The existing maintained ROW on the mainline, Crystal Lake Tap Line and Athol Tap Line is roughly 85-ft, 75-ft and 100-ft, respectively. To provide the necessary clearances for the replacement and new structures, the mainline and Crystal Lake Tap ROWs will be cleared to 100-ft and the Athol Tap ROW will be cleared to 125-ft. It is anticipated that approximately 105 acres on ROW and 18 acres off ROW will be removed to meet the required horizontal clearances. Following the completion of construction, maintenance activities will be consistent with the Five-Year Vegetation Management Plan (2019-2023), and subsequent approved plans, presented in *Appendix D*.

Routine vegetation management will continue within the ROW in accordance with NEP's approved VMP, see *Appendix D*. This plan was completed in compliance with 333 CMR 11.00, as well as all applicable state and federal regulations that mandate the management of utility ROWs, including, but not limited to: all applicable clauses of Chapter 85 of the Acts of 2000; the Massachusetts Endangered Species Act (MESA) and its regulations 321 CMR 10.00; 310 CMR 10.00, and 310 CMR 22.00; applicable Federal Regulatory Commission standards including NERC Standard FAC-003-5, Commissioner Order 693, and all applicable Federal Occupational Safety and Health Act, Department of Transportation and Department of Environmental Protection regulations.

As part of an Integrated Vegetation Management ("IVM") program, NEP's professional arborists oversee the uses of mechanical, natural, and chemical (herbicide application) methodologies when considering controls to maintain a ROW. Trained and licensed herbicide applicators use hand-held equipment under the direct supervision of certified supervisors/foremen. Vegetation management is necessary to ensure safe, reliable delivery of electric service through the transmission and distribution lines located on NEP ROWs. Tall growing tree species must be prevented from growing into or falling onto the lines. Dense woody vegetation, vines, invasive, and poisonous vegetation is removed from around structures, access roads, and anywhere in which they prevent access to the ROW for inspections, maintenance, repairs and emergency access to the lines. Mitigation measures are incorporated into the VMP procedures, and no significant adverse impacts are anticipated because of VMP implementation. Tree removal is also necessary to facilitate the construction of off-ROW access roads.

Table 9 summarizes the extent of tree/vegetation removal for the proposed Project.

Table 9: Summary of Estimated Tree Removal in MA²⁰

Tree Removal Location	Approximate Acres on ROW	Approximate Acres Off ROW

DFW/WMA	14	1

3.3.3 Access Routes, Work Pads/Envelopes and Pull Pads

3.3.3.1 Access Road Routes

As detailed in *Sections 1.6.1*, historic access roads/paths will require significant improvement to meet the access requirements for the Project and are categorized as either Standard Road Type 1-2 or Designed Road Type 3-5 as shown on the MEPA General Purpose Plans in *Appendix A*.

A summary of proposed access route types along with its impacts on ROW and off ROW is provided in *Table 10*. In addition, on ROW, the anticipated limit of cut/fill area is approximately 266 acres and off ROW is approximately 12 acres. Below are the summarized quantities of proposed access route types within the Commonwealth of Massachusetts.

Table 10: Summary of Proposed Access Routes

Type	Quantity on ROW	Quantity on off ROW
Standard Road Type 1 & 2 (lf)	875	6,309
Designed Road Type 3-5 (lf)	161,023	18,821
Existing (lf)	7,121	42,721
Temporary Construction Matting²² (sf)	3,419,471	300,156

3.3.3.1.1 Access Within DCR Properties

As discussed in *Section 3.3.1*, the existing ROW traverses the Leominster, Otter River, Royalston and Warwick State Forests. These properties are owned, maintained, and managed by DCR. The proposed Project will involve the construction of approximately 8 lf of Standard Road Type 1 & 2 on ROW, and

²⁰ Tree clearing amount was calculated by totally tree clearing for clearance with the conductor and tree clearing associated with the limit of disturbance.

²¹ Tree clearing approximations determined by GIS analysis of TLE Lidar imagery, ROW Survey and Riverfront Area Polygons.

²² Include matting for work envelopes, pull pads, access road and limit of disturbance matting in BVW and Isolated Wetlands, residential lawns and agricultural fields.

approximately 533 lf off ROW within the Warwick State Forest. No Standard Road Type 1 & 2 are proposed with the Leominster, Otter River, or Royalston State Forests.

The proposed Project will involve the construction of approximately 24,603 lf of Designed Road Type 3 – 5 within the ROW on DCR Property, and approximately 4,094 lf off ROW within the aforementioned DCR properties. As noted in *Section 3.3.3* above, wetland areas will be crossed using temporary construction matting. The following table, *Table 11*, summarizes impacts by access road type within the boundaries of DCR-owned properties.

Table 11: Summary of Project Impacts Within DCR Properties (as noted below)

Activity	Quantity ²³			
	On ROW		Off-ROW	
	Linear Feet	Square Feet	Linear Feet	Square Feet
Leominster State Forest				
Standard Road Type 1 & 2	N/A	N/A	N/A	N/A
Designed Road Type 3 - 5	3,096	37,152	2	24
Existing	N/A	N/A	N/A	N/A
Matting (Temporary) ²⁴	1,508	24,123	N/A	N/A
Royalston State Forest				
Standard Road Type 1 & 2	N/A	N/A	N/A	N/A
Designed Road Type 3 - 5	1,055	12,660	524	8,384
Existing	N/A	N/A	N/A	N/A
Matting (Temporary)	794	12,705	16	262
Otter River State Forest				
Standard Road Type 1 & 2	N/A	N/A	N/A	N/A
Designed Road Type 3 - 5	5,036	60,432	14	168
Existing	N/A	N/A	N/A	N/A
Matting (Temporary)	3,034	48,544	N/A	N/A
Warwick State Forest				
Standard Road Type 1 & 2	8	96	533	6,396
Designed Road Type 3 - 5	15,416	184,992	3,553	42,636
Existing	23	276	3,625	43,500
Matting (Temporary)	8,550	136,797	1,442	23,067

²³ SF of standard road, designed road and existing calculated with a travel width of 12-ft. Existing road or access are those that does not require improvements or modifications.

²⁴ Includes matting for work envelopes, pull pads, access roads and limit of disturbance matting.

3.3.3.1.2 Off-ROW Access Routes

The majority of the access routes leading onto the ROW are already established (i.e. from existing public ways, parking lots, or gravel pits). However, in nine (9) municipalities off-ROW land will be utilized for access. Most of these areas are off-ROW access routes where construction vehicles will use existing (unpaved) access roadways with improvements, as needed, or use re-established access routes that have more recently gone unused. There are several areas where off-ROW access roads will be established.

Where access roads exist, they generally have an 8-ft-wide travel lane. All off-ROW access roads are in uplands and upland portions of these access routes will be maintained after the Project is completed to allow for maintenance equipment to access the site, although actual post-construction conditions will be determined by NEP's agreements with individual property owners.

3.3.3.2 Work Pads/Envelopes and Pull Pads

Work envelopes will be placed at all structures where work is proposed. Work envelopes are necessary to accommodate the removal of existing structures, installation of new or replacement structures and their appurtenant features. Similarly, pull pads are being used to install new conductor, overhead transmission wire and OPGW. Pull pads are necessary to stage equipment being used to install new conductor and OPGW (see *Appendix A: MEPA General Purpose Plans*).

Temporary construction matting will be placed in locations where access is required to cross wetland resource areas. As the majority of the terrain throughout the ROW is rocky, uneven, and steep, the relocation of boulders²⁵ may be warranted to ensure safe mat placement. Relocated boulders will remain on-site (i.e., within the A1/B2 Lines existing easement). Within wetlands and agricultural fields, construction matting will be utilized to provide a safe work area. In the remaining upland work areas, stone work pads will be constructed. In general, the work envelopes have been designed to be up to approximately 157-ft by 80 to 100-ft depending on the width of the ROW and extent of grading required to create the level work area and provide adequate space for the typical live line construction associated with the Project's scope of work. The use of construction mats minimizes the need to remove vegetation beneath the access way and reduces the degree of soil disturbance and rutting in soft soils. Typical construction mats used by NEP are comprised of wooden timbers bolted together into 4-ft by 16-ft sections, wooden lattice mats, or composite mats. Similarly, pull pads may require grading or temporary construction mats in specific locations to support pulling of conductors and/or OPGW. Refer to EG-303NE in *Appendix C* for additional details. Approximately 2,200,651 sf of temporary construction matting within wetlands is anticipated for this Project.

3.3.3.3 Limit of Disturbance

It is anticipated that construction activities and materials will be confined to the LOD as shown on the MEPA General Purpose Plans in *Appendix A*, as described in *Section 1.6.2*. Within the LOD, equipment access, the placement of temporary BMPs, soil stockpiling and equipment maneuvering is anticipated. In addition, where applicable, tree removals are preliminarily assumed within the LOD zone due to the anticipated secondary impacts from grading activities. The proposed LOD overlaps with approximately 5 acres of DCR property. There is no disturbance or grading anticipated outside of the NEP's easement on DCR property for the construction of work envelopes, and pull pads; however, there are existing trails that are being improved outside of the ROW.

²⁵ Boulders vary in size from small to large stones.

The proposed LOD occupies 141 acres within the ROW and approximately 55 acres off ROW, excluding temporary construction matting which will be utilized with wetlands, residential lawns, and agricultural areas. NEP will coordinate with landowners to obtain temporary construction access, as necessary. Due to the land use constraints within Article 97 lands, construction access will be limited to the easement. As the Project design advances modifications, such as adding additional retaining walls, may be necessary to stay within the confines of the easement.

3.4 MITIGATION MEASURES FOR LAND

The Project design reflects NEP's significant efforts first to avoid and then to minimize adverse impacts to the land surrounding the Project site to the extent practicable. For example, NEP located the Project entirely within an existing ROW. Where feasible, the new foundations will be located to avoid adverse impacts. Also, the proposed design locates proposed structures in proximity to existing structures, whenever feasible; places proposed structures so that the transmission wires span several resource areas; clears vegetation only where necessary for safe operation; and utilizes existing/upland roadways for construction purposes. Overall, the Project is not expected to change or significantly impact land uses within the ROW or areas within 300-ft of the ROW during construction or operation as it is an existing transmission line.

NEP will submit a Stormwater Pollution Prevention Plan ("SWPPP") for the Project in compliance with the EPA's National Pollutant Discharge Elimination System ("NPDES") program under the Stormwater Construction General Permit. The SWPPP establishes a construction period contact list, presents a description of the proposed work, and identifies stormwater controls, spill prevention, and inspection practices to be implemented for the management of construction-related stormwater discharges from the Project. The SWPPP clearly identifies parties responsible for monitoring and reporting any activities out of compliance with the SWPPP or other environmental permits or approvals, and for handling extraordinary situations. The SWPPP also defines monitoring to occur until all disturbed areas on the site have been stabilized using standard BMPs. In this manner, the potential impacts associated with land disturbance (e.g., erosion and sedimentation) will be proactively managed so that impacts can be avoided. See *Section 12: Mitigation and Section 61 Findings*.

4.0 WETLANDS AND WILDLIFE

4.1 INTRODUCTION

Vanessa Hangen Brustlin, Inc (“VHB”) and BSC Group, Inc. (“BSC”), as consultants to NEP, delineated wetland resources along the Project route between Spring 2020 and Summer 2021, and Spring 2022. During the field investigations, 462 wetland areas and 128 streams were identified and delineated within MA. Since this Project consists of existing transmission assets, wetland resource areas cannot be completely avoided. In these instances, appropriate mitigation measures will be provided.

This section presents an overview of the identified and delineated wetlands and waterways along the Project route. Additional information and photographs are presented in *Appendix E: Supplemental Wetlands Information*. This information has been used by the design team to avoid, minimize, and/or mitigate work within sensitive resource areas as well as evaluate Project-related impacts.

4.2 PRELIMINARY DATA REVIEW

Before the start of the wetland field investigations/delineation, existing information was reviewed regarding the presence or absence of wetlands within the ROW. These source materials included:

- USGS Topographic Maps
- USGS Color Ortho Imagery (various years)
- U.S. Fish & Wildlife Service National Wetlands Inventory (“NWI”) MassGIS Datalayer
- MassGIS MassDEP Wetlands 1:12,000 Datalayer
- MassGIS 2021 Natural Heritage and Endangered Species Program (“NHESP”) Priority Habitats of Rare Species Datalayer
- MassGIS 2021 NHESP Estimated Habitats of Rare Wildlife Datalayer
- MassGIS NHESP Certified Vernal Pools Datalayer
- MassGIS NHESP Potential Vernal Pools MassGIS Datalayer
- MassGIS FEMA (“Federal Emergency Management Agency”) Q3 Flood Datalayer and FEMA Flood Insurance Rate Maps
- MassGIS Soils Datalayer

This information was synthesized and used in the field to assist wetland scientists in the location and identification of wetland systems along the Project route.

4.3 WETLAND DELINEATION METHODOLOGY/PROCEDURE

Surveys for wetland resource areas were conducted within the existing transmission line ROW and off ROW access route proposed locations in the municipalities of Warwick, Royalston, Athol, Winchendon, Gardner, Westminster, Fitchburg, Leominster, and Sterling. Field teams used established delineation procedures as outlined in the Massachusetts Department of Environmental Protection’s Handbook on Delineating Bordering Vegetated Wetlands (March 1995) (“DEP Handbook”) and U.S. Army Corps of Engineers (“USACE”) Wetland Delineation Manual (“Environmental Laboratory, January 1987”) (“1987 Manual”) and the USACE Interim Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Northcentral and Northeast Region (“USACE Supplement”) (2012). An excerpt of VHB’s Wetland Delineation Report specific to wetlands identified in Massachusetts along with photographs is presented in *Appendix E: Supplemental Wetlands Information*.

4.4 WETLAND RESOURCE AREAS

The Project is located within three (3) major watersheds including the Connecticut, Millers, and Nashua Watersheds. Of the three (3) watersheds intersected by the transmission line and tap lines, the largest is the Connecticut Watershed (11,260 square miles) and the smallest is the Millers River Watershed (392 square miles). The majority of the Project area is located within the Millers River Watershed.

The Connecticut Watershed is comprised of 11,260 square miles of wetlands, connecting 148 tributaries, including 38 major rivers and several lakes and ponds. The Miller River Watershed is comprised of 390 square miles of wetlands, about 313 square miles of which are in Massachusetts, connecting 107 lakes and ponds. The Nashua River Watershed is comprised of 538 square miles of wetlands, about 454 square miles of which are in Massachusetts, connecting six (6) major tributaries.

4.4.1 Waterways

On ROW, 37 intermittent streams and 55 perennial streams were identified during the delineation of the A1/B2 Lines. Off-ROW, 23 intermittent streams and 13 perennial streams were identified. There are 15 streams that have been designated by the Massachusetts Division of Fisheries and Wildlife (“DFW”) as significant cold-water resources. These include: Pauchaug Brook, Kidder Brook, Collar Brook, Fish Brook, Tully Brook, East Branch Tully River, Lawrence Brook, Boyce Brook, West Gulf Brook, Mellen Brook, Bailey Brook, Fall Brook, Slack Brook, Burnt Mill Pond Brook, and Lemerise Brook. Other named perennial watercourses include Fish Brook, Beaver Brook, Miller’s River, Beaman Brook, Wilder Brook, Parlay Brook, Foster Brook, and Reservoir Brook.

Stream substrates vary from stream to stream, and are comprised of boulder, cobble, gravel, sand, silt, and organic bottoms. Bank widths are also variable ranging from 0 to 60-ft in width.

According to the Massachusetts Surface Water Quality Standards and Classifications (Regulations 314 C.M.R. 4.00) there were multiple Class A and Class B waters within the delineation scope. Class A waters identified included: Richard Reservoir, Fish Brook, Perley Brook, Burn Millpond Brook, Notown Reservoir, Goodfellow Brook, Black Brook, and Fall Brook Reservoir. Class B waters identified included Tully Brook, Collar Brook, East Branch Tully River, Boyce Brook, Beaver Brook, Otter River, Millers River, and Wilder Brook.

Work is proposed within Outstanding Resource Waters (“ORWs”). Structure replacements, both steel direct embed structures and caisson foundations, temporary construction mat access and work envelopes are proposed within wetlands mapped as ORW associated with Goodfellow Pond, Simonds Pond, Notown Reservoir, Distributing Reservoir, Morse Reservoir, Fall Brook Reservoir, and Perley Brook Reservoir. Fall Brook Reservoir and Notown Reservoir are Class A Public Water Supplies (Class A Surface Water Source).

4.4.2 Wetland Characterization

The existing overhead transmission line ROW contains a variety of wetlands, most of which have been historically affected by the routine vegetation management for the safe operation of the transmission facilities. These wetlands typically consist of scrub-shrub, emergent marsh, or wet meadow communities. In accordance with the federal classification system found in Cowardian (1979), the following wetland community types were identified on the existing ROW:

Table 12: Wetland Community Types by Municipality

Cowdian Classification	Municipality								
	Warwick	Royalston	Athol	Winchendon	Gardner	Westminster	Fitchburg	Leominster	Sterling
Palustrine Emergent Persistent/Non-Persistent Seasonally Saturated (“PEM1B/PEM2B”)								X	
Palustrine Emergent Non-Persistent Seasonally Saturated/Seasonally Flooded (“PEM2B”)				X	X				X
Palustrine Emergent Non-Persistent Seasonally Saturated/Seasonally Flooded (“PEM2B/2C”)	X								
Palustrine Emergent Non-Persistent Seasonally Flooded/Permanently Flooded (“PEM2B/2Hb”)						X			
Palustrine Emergent Non-Persistent Seasonally Saturated/Seasonally Flooded/Semi-Permanently Flooded (“PEM2B/2C/2E”)		X							
Palustrine Emergent Non-Persistent Seasonally Saturated/Seasonally Flooded (“PEM2B/2C/2Fb”)			X						
Palustrine Emergent Persistent Seasonally Flooded (“PEM1C”)									
Palustrine Emergent Non-Persistent Seasonally Flooded (“PEM2C”)							X		
Palustrine Scrub Shrub Broad-leaved Deciduous Seasonally Saturated (“PSS1B”)			X			X			X
Palustrine Scrub Shrub Broad-leaved Deciduous Seasonally Saturated/Seasonally Flooded (“PSS1B/1C”).	X						X	X	
Palustrine Scrub Shrub Broad-leaved Deciduous Seasonally Saturated/Seasonally Flooded/Semi-Permanently Flooded (“PSS1B/1C/1E/1F”)		X			X				
Palustrine Scrub Shrub Broad-leaved Deciduous Seasonally Saturated (“PSS1B/1C/1E/1F/1G”)				X					
Palustrine Forested Broad-leaved Deciduous Seasonally Saturated (“PFO1B”)	X	X	X	X	X			X	
Palustrine Unconsolidated Bottom Semi-Permanently Flooded Beaver (“PUB1Fb”)					X				

Palustrine Forested Wetlands (“PFO”) are dominated by woody tree species that lose their leaves in the fall and become dormant until the spring. The hydrology of PFO wetlands vary significantly and may be

inundated or saturated for different lengths of the year. Because hydrology is variable, soil and vegetation types may vary as well.

Wetland vegetation common in PFO wetlands delineated within the ROW included: eastern white pine (*Pinus strobus*), red maple (*Acer rubrum*), red oak (*Quercus rubra*), eastern hemlock (*Tsuga canadensis*), Speckled Alder (*Alnus incana*), Common winterberry holly (*Ilex verticillata*), highbush blueberry (*Vaccinium corymbosum*), partridgeberry (*Mitchella repens*), and cinnamon fern (*Osmundastrum cinnamomeum*). Signs of hydrology included water-stained leaves, high water table, saturation, inundation visible on aerial imagery, geomorphic position, and microtopographic relief. Soils were generally classified as having a Depleted Matrix F3, Redox Dark Surface F6, or Thick Dark Surface A12.

Palustrine Emergent Wetlands (“PEM”) are dominated by herbaceous vegetation, though there can be some trees and shrubs present. The hydrology of PEM wetlands can vary considerably from being seasonally inundated in certain situations to permanently flooded in others. Substrates in PEM wetlands vary with hydrology. Soils associated with permanently flooded areas may consist entirely of organic soils, or mineral soils enriched with organic materials. PEM wetlands that are saturated for only portions of the year are generally mineral soils.

Wetland vegetation common in PEM wetlands delineated within the ROW included: cinnamon fern, marsh fern (*Thelypteris palustris*), sensitive fern (*Onoclea sensibilis*), royal fern (*Osmunda spectabilis*), three-way sedge (*Dulichium arundinaceum*), sallow sedge (*Carex lurida*), common wooldsedge (*Scirpus cyperinus*), eastern star sedge (*Carex radiata*), tall white-aster (*Doellingeria umbellata*), New England American-aster (*Symphytotrichum novaeangliae*), common soft rush (*Juncus effusus*), sharp-fruited rush (*Juncus acuminatus*), American bur-reed (*Sparganium americanum*), rattlesnake manna grass (*Glyceria canadensis*), bluejoint Canada reed grass (*Calamagrostis canadensis*), rice cut grass (*Leersia oryzoides*), white meadowsweet (*Spiraea alba*), bristly blackberry (*Rubus hispidus*), common wrinkle-leaved goldenrod (*Solidago rugosa*), American witch-hazel (*Hamamelis virginiana*), jewelweed (*Impatiens capensis*), arrow-leaved tearthumb (*Persicaria sagittata*), Devil's beggar-ticks (*Bidens frondosa*), boneset thoroughwort (*Eupatorium perfoliatum*), and partridgeberry. Dominant woody species included smooth arrowwood (*Viburnum dentatum*), glossy false buckthorn (*Frangula alnus*), highbush blueberry, winterberry (*Ilex verticillata*), speckled alder, gray birch (*Betula populifolia*), and red maple scattered throughout or along the periphery. Signs of hydrology include water-stained leaves, high water table, saturation, hydrogen sulfide odor, inundation visible on aerial imagery, geomorphic position, drainage patterns, FAC-neutral test, and microtopographic relief. Soils were generally classified as having a Depleted Matrix F3, Redox Dark Surface F6, Thick Dark Surface A12, Histisol A1, and Histic epipedon A2.

Palustrine Scrub Shrub Wetlands (“PSS”) are dominated by woody deciduous plants that are less than 20-ft tall. The hydrology of a PSS wetland can vary between wetlands but is generally categorized as having shallow inundation or soil saturation in the early spring followed by extended periods of dry conditions during the late spring, summer and fall. Soils within PSS wetlands generally consist of mineral soils with minor amounts of organics.

Dominant vegetation included glossy buckthorn (*Frangula alnus*), highbush blueberry, cinnamon fern, various sedges (*Carex sp.*), maleberry (*Lyonia ligustrina*), bristly blackberry, royal fern, white meadowsweet, sensitive fern, speckled alder, and gray birch.

Common signs of hydrology included saturation, drainage patterns, FAC-neutral test, oxidized rhizospheres on living roots, geomorphic position, microtopographic relief, surface water, high water table, and water-stained leaves. Soils varied and included Sandy Redox S5, Depleted Matrix F3, Redox Dark Surface F6,

Histosol A1, Depleted Below Dark Surface A11, Depleted Dark surface F7, Histic Epipedon A2, Histisol A1, and Very Shallow Dark Surface TF12.

4.4.3 State Wetland Resource Area Classification and Evaluation

State regulated wetland resource areas found within and immediately adjacent to the ROW along the Project route consist of BVW, BLSF, Isolated Land Subject to Flooding (“ILSF”), Bank, LUW, and RA, as described below. Vernal Pool habitat is also discussed in terms of NHESP Designated potential vernal pools (“PVPs”) and certified vernal pools (“CVPs”). Each type of wetland has an associated set of regulatory performance standards. The Project’s approach to meeting these standards is addressed in *Section 11: Regulatory Compliance*.

Bordering Vegetated Wetlands: BVW is defined at 310 CMR 10.55(2) as freshwater wetlands (wet meadows, marshes, swamps, and bogs) which border on creeks, rivers, streams, ponds and lakes. BVWs are areas where the soils are saturated and/or inundated such that they support a predominance of wetland indicator plants. The ground and surface water regime and the vegetation community which occur in each type of freshwater wetland are specified in the Massachusetts Wetlands Protection Act (WPA) G.L. c. 131, § 40.

Due to ROW vegetation maintenance activities, the majority of BVW delineated along the existing ROW have dominant elements of both PEM and PSS vegetation. All dominant PEM wetlands delineated have a significant element of PSS vegetation, but not vice versa.

Bordering Land Subject to Flooding: BLSF is defined at 310 CMR 10.57(2)(a) as an area with low, flat topography adjacent to and inundated by flood waters rising from creeks, rivers, streams, ponds or lakes. BLSF extends from the banks of these waterways and water bodies; where a BVW occurs, it extends from said wetland. The boundary of BLSF is the estimated maximum lateral extent of flood water which will theoretically result from the statistical 100-year frequency storm.

Isolated Vegetated Wetlands (“IVW”) and Isolated Land Subject to Flooding: ILSF is defined at 310 CMR 10.57(2)(b) as an isolated depression or a closed basin that serves as a ponding area for run-off or high ground water which has risen above the ground surface. Isolated wetlands are not jurisdictional resource areas under the WPA unless they hold enough water to meet the definition of ILSF (310 CMR 10.57(2)(b)). Protection of IVW varies by municipality and are often afforded local protection regardless of size. During field investigations, wetlands were not delineated beyond the utility ROW. Off-ROW hydrologic connections were assumed for wetlands located on the border of the ROW.

Inland Bank: Bank is defined at 310 CMR 10.54(2) as the portion of the land surface, which normally abuts and confines a water body. It occurs between a water body and a vegetated bordering wetland and adjacent floodplain, or, in the absence of these, it occurs between a water body and upland. A Bank may be partially or totally vegetated, or it may be comprised of exposed soil, gravel or stone. The physical characteristics of a Bank, as well as its location, are critical to the protection of wildlife. The upper boundary of a Bank is the first observable break in the slope or the mean annual flood level, whichever is lower. The lower boundary of a Bank is the mean annual low flow level.

Land Under Waterbodies and Waterways: LUW is defined at 310 CMR 10.56(2) as the land beneath any creek, river, stream, pond or lake. The boundary of LUW is the mean annual low water level. Land under all ponds, lakes, perennial and intermittent streams, located within the Project route, is afforded protection under the WPA (G.L. c. 131, § 40) and regulations at 310 CMR 10.56.

Riverfront Area: RA is defined at 310 CMR 10.58(2) as the area of land between a river’s mean annual high-water line and a parallel line measured horizontally. RA may include or overlap other resource areas or their buffer zones. The RA does not have a buffer zone.

Under the 310 CMR 10.58(2)(1), 200-ft RA is given to the following:

- A. A river or stream shown as perennial on the current United States Geological Survey (“USGS”) or more recent map provided by the Department is perennial.
- B. A river or stream shown as intermittent or not shown on the current USGS map or more recent map provided by the Department, that has a watershed size greater than or equal to one (1) square mile, is perennial.
- C. A stream shown as intermittent or not shown on the current USGS map or more recent map provided by the Department, that has a watershed size less than one (1) square mile, is intermittent unless:
 - i. The stream has a watershed size of at least ½ (0.50) square mile and has a predicted flow rate greater than or equal to 0.01 cubic feet per second at the 99% flow duration using the USGS Stream Stats method. The issuing authority shall find such streams to be perennial; or
 - ii. When the USGS StreamStats method cannot be used because the stream does not have a mapped and digitized centerline (including but not limited to streams located in the following basins: North Coastal Basin, Taunton Basin, Buzzards Bay Basin, Cape Cod and Islands Basin, and that portion of the South Coastal Basin that is south of the Jones River sub-basin), and the stream has a watershed size of at least ½ (0.50) square mile, and the surficial geology of the contributing drainage area to the stream at the project site contains 75% or more stratified drift, the issuing authority shall find such streams to be perennial. Stratified drift shall mean sand and gravel deposits that have been layered and sorted by glacial meltwater streams. Areal percentages of stratified drift may be determined using USGS surficial geologic maps, USGS Hydrological Atlases, Massachusetts Geographical Information System (MassGIS) surficial geology data layer, or other published or electronic surficial geological information from a credible source.”

Vernal Pool Habitat: Vernal Pool habitat is defined at 310 CMR 10.04 as confined depressions that hold water for two (2) continuous months during spring and/or summer most years, and which are free of adult fish, including a 100-ft buffer if that area is within a jurisdictional wetland pursuant to the WPA and regulations.

4.5 LOCAL RESOURCE AREA CLASSIFICATION AND EVALUATION

Local wetland resource areas are those wetlands that are provided additional protection beyond that provided by the WPA and/or are not provided protection under the WPA and the state wetlands regulations. For example, local bylaws may provide additional interests or performance standards to a wetland resource area. Additionally, isolated wetlands may be provided protection by a local wetland bylaw or ordinance that claims jurisdiction over these areas. In addition, several municipalities also consider the 100-ft buffer zone a wetland resource area as opposed to an upland buffer. Municipalities that have implemented a wetland bylaw or ordinance are described below (*Table 13 Additional Bylaw Protections by Municipality*):

Table 13: Additional Bylaw Protections by Municipality

MUNICIPALITY	ADDITIONAL BYLAW PROTECTION BY MUNICIPALITY
ATHOL	No Wetlands Bylaw.
FITCHBURG	Additional jurisdictional resource areas include all isolated wetlands, vernal pools, kettle holes, and 100-ft Buffer Zone to Resource Areas (not including FEMA 100-Year Floodplain/BLSF). 50-ft No Disturb Zone and 75-ft No Build Zone.
GARDNER	Additional jurisdictional resource areas include all vernal pools, intermittent streams, and 100-ft Buffer Zone to Resource Areas (not including FEMA 100-Year Floodplain/BLSF). 30-ft No Disturb Zone and 60-ft No Build Zone.
LEOMINSTER	No Wetlands Bylaw.
ROYALSTON	No Wetlands Bylaw.
STERLING	No Wetlands Bylaw.
WARWICK	No Wetlands Bylaw.
WESTMINSTER	Additional jurisdictional resource areas include all vernal pools. 25-ft No Disturbance Zone.
WINCHENDON	Additional jurisdictional resource areas include all vernal pools, ponds of any size, springs, intermittent streams, and 100-ft Buffer Zone to Resource Areas (not including FEMA 100-Year Floodplain/BLSF).

4.5.1 Wildlife

This section discusses wildlife and associated habitat characteristics commonly found in the types of wetlands that are present along the Project route.

PSS Wetlands: A variety of birds, mammals, reptiles, amphibians and invertebrates are known to use the habitat provided by PSS wetlands. The diverse vegetation and structural features associated with forested (and scrub-shrub) wetlands provide feeding, breeding, nesting, and cover for a variety of wildlife species. Important wildlife habitat characteristics found within Project impact areas include:

- Wetland/ Aquatic food plants
- Upland/wetland food plants (hard mast and fruit)
- Shrub thickets/stream beds with abundant earth worms
- Thick shrub/herbaceous cover (suitable for Veery nesting)
- Standing dead tree (snag)
- Dense herbaceous cover
- Small mammal burrows
- Tree roots under water’s surface
- Large woody debris on ground
- Rock piles and crevices
- Depressions that may serve as seasonal vernal pools
- Areas of ice-free open water in winter
- Emergent wetland pockets
- Intermittent streams

Wildlife commonly found in PSS wetland communities include birds such as: common yellowthroat (*Geothlypis trichas*), song sparrow (*Melospiza melodia*), common grackle (*Quiscalus quiscula*), and American goldfinch (*Carduelis tristis*). Small mammals include the water shrew (*Sorex palustris*), short-tailed shrew (*Blarina bevicauda*), white-footed mouse (*Peromyscus leucopus*), star nosed mole (*Condylura cristata*), eastern chipmunks (*Tamias striatus*) and eastern cottontail (*Sylvilagus floridanus*). Larger species, such as ruffed grouse (*Bonasa umbellus*), wild turkeys (*Meleagris gallopavo*), skunks (*Mephitis mephitis*),

raccoons (*Procyon lotor*), Virginia opossums (*Didelphis virginiana*), and woodchucks (*Marmota monax*) may also be present.

PEM Wetlands: Wildlife commonly found in PEM wetland communities include: American toad (*Bufo a. americanus*), northern spring peeper (*Pseudacris c. cineris*), wood frog (*Rana clamitans melanota*), red winged black bird (*Agelaius phoeniceus*), swamp sparrow (*Melospiza georgiana*), and common yellowthroat (*Geothlypis trichas*).

4.6 IMPACTS TO WETLANDS AND WILDLIFE

The Project's anticipated wetland impacts include areas within the ROW as well as any off-ROW resource areas that are impacted. This section provides an overview of the temporary and permanent impacts of access roads and construction areas in BVWs, 100-ft Buffer Zone to BVW, other wetland areas and Wildlife within the work areas.

Overall, impacts to wetland resource areas are anticipated to have both temporary and permanent impacts on the resource areas and its associated buffer zones due to comprehensive nature of the refurbishment (including new structures) and access improvements and establishment of new access. Additionally, incremental changes to the existing footprint of power line structures and access roads might have temporary and long-term impacts on the wildlife, but they will be localized to the immediate areas within the ROW. Wildlife habitats will remain intact. NEP proposes to address all the impacts and provide appropriate wetland mitigation to offset any permanent wetland impact.

- Temporary impacts include construction matting, soil stockpiling and maneuvering equipment within the Limit of Disturbance.
 - Temporary impacts are anticipated within Bank, BVW, Isolated Wetlands, RA, BLSF and LUW.
- Permanent impacts include tree removal for horizontal clearance with the overhead line and within the Limit of Disturbance; fill within BVW, Isolated Wetlands, LUW, and BLSF associated with new concrete caisson foundations; cut/fill associated with road building, work envelopes and pull pads; and access road re-establishment and establishment of new access roads.
 - Permanent impacts are anticipated within BVW, Isolated Wetlands, RA, BLSF, LUW and Buffer Zone.

Table 2 above presents a summary of wetland resource area impacts. Wetland Resource Areas are shown on the *MEPA General Purpose Plans in Appendix A: Figures*. The discussion of wildlife impacts is incorporated into the wetlands impact analysis, below.

4.6.1 TEMPORARY IMPACTS

4.6.1.1 Bordering Vegetated Wetlands

Temporary impacts to BVW are anticipated due to construction mats used for access roads and construction areas (e.g., construction work envelopes, and pull pads). A typical construction mat detail is presented in *Appendix C*. Construction mats are placed over existing vegetation (i.e., there is little or no ground disturbance). After all work is completed, construction mats will be removed, and the site restored to preconstruction condition after approximately one growing season.

Access Roads: Since this Project involves comprehensive refurbishment activities and system improvements to the existing assets, upland access options were infeasible in some areas due to extensive wetlands within the ROW and a number of constraints (e.g., steep slopes, avoiding cultural resources). In these areas, existing access roads will be improved or re-established to provide safe access for vehicles

during construction and for the future operation and maintenance of the transmission lines and tap lines. The construction of new access roads will require either cut or fill, and placement and compaction of imported gravel. NEP has established standards for establishing access roads as described in *EG-303NE, Appendix C*. Access roads are being designed for a 12-ft wide travel lane.

Where present, BVW will be stabilized by placement of temporary construction mats. The area of disturbance is approximately 16-ft wide. Although new, re-established, or improved upland access routes may be maintained as such, construction mats used along access roads during construction will be removed from the BVWs.

BVWs that will be temporarily impacted for refurbishment activities are identified in Table 14.

Construction Areas: The installation of new structures/or replacement of structure foundation, and placement of work envelopes in or near BVW, and activities within the LOD will result in short-term impacts associated with the use of construction mats within BVW.

Construction work envelopes will vary in size based on various factors, for example specific activities and equipment required at each location and topographical constraints. In general, the work envelopes have been designed to be up to approximately 157-ft by 80 to 100-ft depending on the width of the ROW and extent of grading required to create the level work area and provide adequate space for the typical

construction associated with the project scope of work. Similarly, pull pads may require grading or temporary construction mats in specific locations to support pulling of conductors and/or OPGW. In addition, BVW impact area was conservatively calculated to include all areas where construction mats are used, but because the mats are installed in 4-ft by 16-ft sections they cannot conform to the exact wetland boundary and often extend beyond the boundaries of the BVW.

BVWs that will be temporarily impacted for refurbishment activities are identified in Table 15.

Resulting impacts from matting associated with access road, work envelopes, pull pads and LOD are anticipated to be approximately 51 acres of BVW. However, these impacts will be limited to the construction phase only.

4.6.1.2 Other Wetland Resource Areas

Access Roads: Temporary construction matting may be used for access where existing access roads do not exist. Stone will be added to some access roads within the BLSF to stabilize the surface and support equipment. Where this is necessary, the existing road surface will be over-excavated and filled with clean gravel or stone so there will be no change in elevation or flood storage capacity. Thus, no compensatory flood storage is required, and no significant temporary or permanent impact is anticipated.

Where stream crossings are required, construction mats will be installed in a manner that will span the Bank, thus avoiding direct temporary impacts to Bank. In most cases, construction mat crossings will span the Bank of rivers and streams. However, the potential for alteration has been accounted for in the review of MEPA thresholds and approximately 67,954 sf of temporary construction matting has been proposed. Crossings are proposed for site access within the medium-sized to larger streams and rivers e.g., the Black Brook, Mirey Brook, Fish Brook, Perley Brook, Boyce Brook, and Fall Brook, located along the Project route. Where crossings are required on open water, and medium-sized to larger streams with spans are greater than 30-ft, temporary impacts to LUW are anticipated. Approximately 32,206 sf of matting is anticipated to temporarily impact LUW.

Construction Areas: There will be temporary impacts to RA, BLSF, and Isolated Wetlands, due to the placement of construction mat work envelopes during the installation of new/or replacement structures and overhead line work and activities within the LOD (*see MEPA General Purpose Plans in Appendix A*). In these instances, the construction mat work envelopes are placed on top of existing vegetation and over intermittent stream channels. As such, roots are not disturbed, earth disturbance is largely avoided, and streams are allowed to flow beneath the mat platform. The construction mats will be removed, and the area restored, as necessary, upon completion of construction. No change in elevation or flood storage capacity will occur related to temporary impacts due to construction matting.

Temporary matting impacts associated with access roads, work envelopes, pull pads and the LOD within RA, BLSF, and Isolated Wetlands is approximately 11 acres, 0.27 acres and 1.64 acres, respectively.

BLSF, IVW, and RA will be temporarily impacted due to mowing for equipment access. See *Table 16* for identification of isolated wetlands within each town with temporary impacts due to matting.

4.6.1.3 Wildlife

During construction, temporary impacts to wildlife may be caused by the presence of construction equipment, construction activities, and habitat alteration/vegetation impacts resulting from construction. The duration of temporary impacts may vary from the period of active construction only, to the following growing season, when vegetation recovers from disturbance. Wildlife using the forested edge of the cleared ROW as well as the ROW itself may be affected. Mobile species such as birds and large mammals will

temporarily leave the area to avoid construction activities and disturbance but may then be impacted by the displacement. Smaller and less mobile animals, such as small mammals and herpetofauna, may be directly impacted by activities within the ROW. The number of individual animals impacted during the construction phase are expected to be relatively few, compared to the total population of any given species in and around the ROW. Temporary impacts will be localized to the immediate areas of construction, which includes only a portion of the ROW, and are not anticipated to be significant to any species at the population level.

4.6.2 PERMANENT IMPACTS

4.6.2.1 Bordering Vegetated Wetlands

Access Roads: NEP evaluated existing and historically used access routes that traverse BVWs to determine whether road improvements in select locations are feasible due to their location, the length of resource area crossed and whether there is an existing historic road base in these areas. No access roads will be established within BVW.

Construction Areas: No permanent impacts to BVW are anticipated for construction areas due to work envelopes or pull pads.

Structures: Concrete caisson foundations will be required for installation of new structures/or replacement structures within BVW, resulting in the permanent fill of approximately 1,896 sf of BVW. In general, approximately 79 sf of fill is necessary for each concrete caisson steel monopole structure. The Project was designed to remove structures from wetlands where possible, resulting in the removal of approximately 36 structures from BVW. 24 structures are proposed with concrete caissons within BVW are highlighted in *Table 17: Fill within BVW for Concrete Caisson Installation* below and on the MEPA General Purpose Plans.

Vegetation Management: To provide a safe area for construction, reliability, maintenance, and operation of the proposed line, vegetation on the existing ROW will continue to be maintained to prevent the growth of tall woody species. In addition, to obtain the minimum horizontal clearance of 30-ft to the edge of ROW under all weather conditions, the existing maintained portion of the ROW will need to be expanded. The existing maintained ROW on the mainline, Crystal Lake Tap and Athol Tap is 85-ft, 75-ft, and 100-ft, respectively. To provide the necessary clearances for the replacement and new structures, the mainline and Crystal Lake Tap ROWs will be cleared to 100-ft and the Athol Tap ROW will be cleared to 125-ft.

Tree removal within BVW and the LOD is anticipated to result in converting approximately 17 acres of PFO to PSS. Following the completion of construction, vegetation maintenance activities will be consistent with the Five-Year Vegetation Management Plan (“VMP”) (2019-2023), and subsequent approved plans, presented in *Appendix D*.

4.6.2.2 100-ft Buffer Zone to BVW and Inland Bank

Access Roads: Impacts to the 100-ft Buffer Zone to BVW and Inland Bank are anticipated due to the improvement/reestablishment of existing access roads and the establishment of new access roads. Approximately 18 acres of permanent impacts are anticipated within 100-ft Buffer Zone to BVW and Inland Bank. Where access roads exist, they are typically 8-ft wide and are comprised of historic fill material. Over time, access roads become degraded through weathering. The width and quality of the existing access roads

do not meet the current NEP standard to safely support construction equipment. To meet the safety and equipment requirements of the Project, NEP will upgrade the existing access roads from their existing width to a 12-ft wide travel lane. In areas where access road improvements are needed, the existing road will be regraded to provide a flat surface for utility equipment. Imported gravel will be added to the access roads where necessary as will be done for new access. Disturbed road shoulders will be stabilized immediately after road construction. Access roads to be improved that approach a wetland will terminate before the delineated limits of the wetland. See *Table 18*, for the anticipated Buffer Zones that will be permanently impacted by access roads.

Construction Areas: Work envelopes, pull pads and the LOD associated with construction access are anticipated to impact the 100-ft Buffer Zone to BVW and Inland Bank. In some locations, work envelope/pull pad improvements are needed to create a stable work platform for the safe operation of utility equipment. Permanent stone work envelope improvements are limited to regrading in the 100-ft buffer zone and upland areas. See *Table 19* for the anticipated Buffer Zones that will be permanently impacted by construction areas.

Approximately 90 acres of disturbance in Buffer Zone is anticipated. Where applicable, exposed soils will be stabilized with stone to prevent erosion and sedimentation to nearby resource areas.

4.6.2.3 Other Wetland Resource Areas

Access Roads: Stone will be added, if necessary, to maintain and expand some roads within the RA and BLSF to stabilize the surface and support equipment. Where this is necessary in BLSF, the existing road surface will be over excavated and filled with clean gravel or stone so there will be no change in elevation or flood storage capacity. While this is a permanent impact, no compensatory flood storage is required, and no significant impact is anticipated. In areas where improved access roads intersect with rare species habitat, impacts and construction methodology will be site specific.

Riverfront areas that will be permanently impacted by refurbishment activities are associated with nine (9) unnamed streams and the following watercourses:

Pauchaug Brook, Black Brook, Mirey Brook, Kidder Brook, Collar Brook, Fish Brook, Boyce Brook, Lawrence Brook, Mill Glen Pond, Bailey Brook, Saw Mill Pond, Notown Reservoir, and Monoosnoc Brook. Other named perennial watercourses include Fish Brook, Beaver Brook, Miller’s River, and Wilder Brook.

Permanent impacts within RA associated with the access road, work envelopes and pull pads will be approximately 31 acres. Where feasible work envelopes and pull pads will be loamed and seeded and allowed to revegetate.

Permanent impacts are not anticipated to occur within BLSF due to access roads, work envelopes or pull pads as these areas will be over-excavated resulting in no loss of flood storage. However, these construction activities will occur within approximately 7 acres.

Structures: New concrete caisson foundation installation will result in permanent fill of approximately 76.6 cy within BLSF and 79 sf within an Isolated Wetland, and alteration of approximately 3,476 sf of RA. BLSF impacts from structures (as noted in *Table 2*) will be offset by compensatory flood storage (see mitigation discussion, below). Two (2) concrete caissons are proposed within LUW in the Crystal Lake Tap in Gardner. Impacts from structures within other wetland resource areas will be negligible after mitigation.

Vegetation Management: To provide a safe area for construction, reliability, maintenance, and operation of the proposed line, vegetation on the existing ROW will continue to be maintained post construction to prevent the growth of tall woody species. In addition, to obtain the minimum horizontal clearance of 30-ft to the edge of ROW under all weather conditions, the existing maintained portion of the ROW will need to be expanded. The existing maintained ROW on the mainline, Crystal Lake Tap and Athol Tap is 85-ft, 75-ft, and 100-ft, respectively. To provide the necessary clearances for the replacement and new structures, the mainline and Crystal Lake Tap ROWs will be cleared to 100-ft and the Athol Tap ROW will be cleared to 125-ft.

Tree removal within BLSF, RA, Isolated Wetland and Bank associated with vegetation cutting and the LOD is anticipated to result in 2 acres, 18 acres, 0.28 acres, and 0.61 acres, respectively. Following the completion of construction, vegetation maintenance activities will be consistent with the Five-Year Vegetation Management Plan (VMP”) (2019-2023), and subsequent approved plans, presented in *Appendix D*.

Approximately six (6) isolated wetlands will be permanently impacted by refurbishment activities, five (5) of the six (6) IVW’s are proposed for tree removals resulting in alteration of a PFO to a PSS. One (1) IVW (RO-W10A) will be permanently impacted by the installation of a concrete caisson foundation, (see *Table 20*).

4.6.2.4 Wildlife

Permanent impacts due to the Project will consist primarily of incremental changes to the existing footprint of power line structures and access roads, the addition of new access roads, and the conversion of forested areas to scrub shrub and emergent habitat types. The change in footprint of these infrastructure components will cause an incremental loss of vegetation and associated habitat. However, these impacts will not affect the long-term ability of the ROW and surrounding area to provide wildlife habitat. After one or two growing seasons, much of the temporary disturbance will be recovered, and only a small portion of the overall habitat provided by the ROW will be permanently impacted by construction. The basic structure of the ROW and type of habitat present (various open and shrubby habitats) will not be changed by the Project. Because the habitat will largely remain intact, when construction-related disturbance ends, most displaced individuals are expected to return and continue using the habitat provided by the ROW. A wealth of research indicates that the early successional habitat provided by ROWs is beneficial to a wide variety of wildlife species (Yahner 2003, King 2002), including birds, reptiles, and amphibians, especially in landscapes that are primarily forested or developed.

4.7 MITIGATION MEASURES FOR WETLANDS AND WILDLIFE

NEP proposes to provide appropriate wetland mitigation that meets local, state, and federal requirements to offset any permanent wetland impacts. While Project information presented herein is thorough with regard to impacts, and many proposed mitigation measures are identified and described, NEP is still evaluating specific details related to wetland mitigation. Permit applications to be submitted to state and federal regulatory agencies will provide the specific mitigation information required for the Project. At the local level, NEP will work with Conservation Commissions to discuss impacts and proposed mitigation as part of the Notice of Intent process. In addition, post construction, NEP will prepare applications for Certificates of Compliance from each of the Conservation Commissions. These Certificates ensure that wetland resources have been restored. NEP is committed to developing a mitigation package appropriate to address impacts of the Project. It is anticipated that mitigation will demonstrate no net loss of existing wetland functions values, and statutory interests within the watershed.

4.7.1. Design and Construction Best Management Practices (“BMPs”)

Construction activities will minimize disturbed areas; use upland/existing access roads and work envelopes where possible; utilize erosion and sedimentation controls; and involve supervision and inspection of construction activities within resource areas by an Environmental Monitor.

General mitigation measures discussed below will reduce wetland resource area impacts associated with each phase of construction. Many of these measures are standard proven procedures that NEP incorporates in all transmission line construction projects. Others are site specific measures designed to meet the needs of the Project.

Structures: During new/or replacement structure installation, erosion and sedimentation controls will be installed along the perimeter of the excavation to avoid sedimentation of the adjacent wetlands. Following excavation, spoil piles will be contained by controls in appropriate upland locations.

Access Roads: As part of the wetland delineation and constructability review, existing and previously used access roads (roads that were established during the construction and/or maintenance of the existing lines that are now overgrown) were documented to determine feasible routes that would avoid and minimize impact to wetland resource areas. Where feasible, access road locations have been chosen to avoid BVW completely (usually by way of off-ROW upland access where available); to minimize impacts by crossing BVW using existing paths (previously impacted areas); or to traverse the BVW at its narrowest location.

Impacts on small streams are minimal and limited to the construction phase only. These impacts consist of temporarily spanning streams with construction mats to allow construction equipment to cross. A detailed erosion and sediment control plan will be designed and implemented (see below). Following construction, temporary construction mat access roads will be removed from BVW and associated intermittent streams. Impacted resource areas will then be restored to pre-construction configurations and contours to the extent practicable. Work occurring in BLSF will either not result in the loss of flood storage capacity, or compensatory flood storage will be provided.

Work Envelopes/Pull Pads: Structure improvements in or near BVW will result in short-term effects associated with the creation of temporary construction work envelopes. Proposed BVW work envelopes will include temporary construction mats placed on top of existing vegetation. Following construction, all mats will be removed from BVW and Bank and the impacted resource areas will then be restored to their pre-construction configurations and contours to the extent practicable.

There is no work proposed in the vicinity of CVPs or NHESP PVPs. However, one field delineated PVP was identified in Warwick. Temporary mats are proposed within this area.

Erosion and Sedimentation Control: In addition to those described above, erosion and sediment control devices will be installed along the perimeter of identified wetland resource areas prior to the onset of soil disturbance activities to ensure that spoil piles and other disturbed soil areas are confined and do not result in downslope sedimentation of wetland resources. Low growing tree species, shrubs, and grasses will be mowed only along access roads and at work envelopes. To avoid disturbing the root mat, tree stumps will be left in place except at work envelopes, structure locations and within access roads.

Dewatering may be necessary during excavations for new/or replacement structures within or adjacent to wetland areas. If there is adequate vegetation in upland areas to function as a filter medium, the water generally will be discharged to the vegetated land surface. Where vegetation is absent or where slope prohibits, water will be pumped into a dewatering basin consisting of a filter bag with haybale or silt fence perimeter controls which will be located in approved areas outside wetland resource areas. The pump intake hose will not be allowed to set on the bottom of the excavation throughout dewatering. The basin and all accumulated sediment will be removed following dewatering operations and the area will be seeded and mulched.

Concrete Wash Outs: Concrete wash outs will be used to manage concrete waste associated with the installation of caisson foundations. Concrete and concrete washout water will not be discharged directly on the ground, in wetlands or waterbodies, or in catch basins or other drainage structures. Where possible, concrete washouts will be located away from wetlands or other sensitive areas. Concrete washout areas will be regularly inspected by an Environmental Monitor.

Environmental Field Issue Document: Per NEP policy, Environmental Field Issue (“EFI”) guidelines are developed for all construction and maintenance projects. At a minimum, the EFI will include the location of sensitive areas to be avoided, a summary of all permit requirements, detailed erosion and sediment control plans, and training requirements/documentation. All contractors and Environmental Monitors will be required to participate in EFI training before beginning work on site. In accordance with a schedule specified in the EFI, regular construction progress meetings will provide the opportunity to reinforce the contractor’s awareness of these matters.

Supervision and Monitoring: Throughout the entire construction process, NEP will retain the services of an Environmental Monitor (“Monitor”). The primary responsibility of the Monitor will be to oversee construction activities, including the installation and maintenance of erosion and sedimentation controls,

on a routine basis to ensure compliance with all applicable permitting requirements. The Monitor will be a qualified environmental scientist responsible for supervising construction activities relative to environmental issues. The Monitor will be experienced in erosion and sediment control techniques described in this narrative and will have an understanding of wetland resources to be protected.

During periods of prolonged precipitation, the Monitor will inspect all locations to confirm that the environmental controls are functioning properly. In addition to retaining the services of a Monitor, NEP will require the contractor to designate an individual to be responsible for the daily inspection and upkeep of environmental controls. This person will also be responsible for providing direction to the other members of the construction crew regarding matters of wetland access and appropriate work methods.

4.7.2 Wetland Resource Area Restoration

NEP uses standard mitigation measures on all transmission line construction projects to minimize impacts on wetland resource areas. These measures include revegetation and stabilization of disturbed wetland and adjacent upland soils and ROW vegetation management practices. Following construction, construction mats will be removed from BVW, and stone used for construction work envelopes, pull pads or guard structure work envelopes (locations to be determined) will be removed from BLSF and RA. Impacted areas will be returned to pre-construction configurations and contours to the greatest practicable extent. Restoration will include loam and seeding disturbed areas, final grading and installation of permanent erosion control devices, where necessary, in the adjacent uplands.

4.7.3 Wetland Replication and Compensatory Flood Storage

Unavoidable alteration due to new concrete caisson foundation installation will result in approximately 1,896 sf of permanent fill in BVW and 76.6 cubic yards (“cy”) of flood storage displacement. Potential replication and compensatory flood storage mitigation measures are outlined below; as noted previously, final details will be developed after consultation with federal, state and local agencies.

Wetland Replication: Potential wetland replication areas to compensate for the approximately 1,896 sf of permanent fill in BVW have been identified and are currently under review by NEP and their consultants. Wetland replication areas will be chosen based on their proximity to impact areas and potential to enhance the functions and values of existing wetland systems. These replications areas will offset nearby impacts related to new structure installations. Wetland seed mix will be applied, and woody vegetation plantings will be installed immediately following grading activities. Replication areas will be monitored as required in local, state and federal permits.

NEP will work with the local Conservation Commissions to finalize mitigation for permanent loss in BVW.

Compensatory Flood Storage: Massachusetts Department of Environmental Protection (“MassDEP”) requires compensation for any loss of 100-year flood storage capacity in accordance with the applicable performance standards of the WPA, as outlined at 310 CMR 10.57(4)(1). In accordance with these requirements, compensatory flood storage mitigation for the Project may include on-site replication at the same incremental elevations as the lost flood storage.

As noted previously, the Project will result in 76.6 cy of flood storage displacement due to the installation of eight (8) concrete caisson foundations. Compensatory flood storage mitigation is proposed for the Project and includes on-site replication at the same incremental elevations as the lost flood storage. Sediment controls will be installed along the perimeter of the excavation area to avoid sedimentation of the adjacent wetlands. Following excavation, the disturbed area will be restored, seeded and/or mulched.

NEP will work with the local Conservation Commissions, to finalize mitigation for permanent loss in flood storage area.

5.0 RARE SPECIES

5.1 INTRODUCTION

To assess the potential for state or federally listed, endangered, threatened, and/or special concern plant and/or animal species along the Project route, NEP reviewed MassGIS 2021 Priority and Estimated Habitat data layers, solicited database information from the Massachusetts NHESP, and followed the U.S. Fish and Wildlife Service (“USFWS”) Endangered Species Consultation Procedure available on their website.

5.2 USFWS

As a result of the USFWS Endangered Species Consultation Procedure, it was determined that four (4) federally listed species may be present within the Project area. One (1) species is a threatened mammal, one (1) species is a candidate insect, one (1) species is an endangered plant, and one (1) species is a threatened plant. Review is ongoing to determine permitting and/or avoidance measures.

5.3 NHESP

Based on NHESP data layers and consultation, the Project route contains 9 state-listed species (two (2) reptiles, one (1) amphibian, two (2) invertebrates, three (3) birds and one (1) plant), along portions of the Project route in Warwick, Royalston, Winchendon, Athol, Fitchburg and Leominster. Specific species are not identified herein at the agency’s request. These areas are within ROW that is maintained per NEP’s VMP and the yearly Operations and Maintenance Plan, as approved annually by NHESP.

This section outlines the pre-consultation process with NHESP, including field surveys and wildlife habitat assessments conducted to date, potential impacts to rare species habitat, and proposed mitigation measures.

5.3.1 NHESP Pre-Consultation Process

NEP is currently consulting with NHESP for the Project. Information regarding the species present within the Project footprint was generated using the Restricted Data regarding rare species presence within National Grid owned properties and easement areas that NHESP provides to NEP annually.

Preliminary Habitat Assessments and Field Surveys: BSC conducted several field visits to assess habitat quality for general wildlife and habitat suitability specifically for listed species in 2021. These field assessments focused on the areas of known occurrence mapped by NHESP, and wetland areas where habitat assessment is required for wetland permitting compliance. Suitable habitat for each of the 9 listed species is present in various locations in the Project area.

To date, BSC has prepared a preliminary memo, summarizing observations and the potential for impacts based on the observed habitat, known biology of the species, standard construction methods, and NHESP-approved, species-specific BMPs. This memo will be submitted to NHESP as part of the consultation process.

5.4 PROPOSED MITIGATION MEASURES

In addition to generally avoiding and minimizing species and habitat impacts to the maximum extent feasible, the Project will use NHESP-approved, species-specific measures to reduce impacts. At this time, NEP is working closely with NHESP and consultation is ongoing. The Project will implement the necessary actions to avoid, minimize, and mitigate Project-related impacts to comply with the MESA permit issued for the Project.

If, after consultation with NHESP, it is determined that a take will occur, a Conservation Management Plan (“CMP”) will be prepared to comply with MESA.

5.5 ANTICIPATED CONCLUSION

Consultation with NHESP is required to determine if the Project can be permitted using the Checklist option under MESA, or if CMP would be required.

6.0 HISTORICAL/ARCHEOLOGICAL RESOURCES

6.1 INTRODUCTION

This section reviews the Project’s potential impacts on cultural resources.

NEP contracted SWCA Environmental Consultants (“SWCA”) to conduct cultural resource due diligence on the Project. SWCA staff conducted background research and a physical inspection of the Project area. Background research involved a review of existing cultural resource reports on file at SWCA and the MHC, correspondence, and previously recorded historic and archaeological site files on file at MHC.

6.2 HISTORIC AND ARCHEOLOGICAL RESOURCES

In September 2020, SWCA conducted a due diligence review and documented known archaeological sites within and in proximity to the Project ROW. The analysis included a review of the State Historic Preservation Offices (“SHPO”) site files for archaeological sites and aboveground resources. For archaeological and cultural resources, the study area was established at 1 km from the A1/B2 centerline within Massachusetts, as well as 1 km from the centerline of the tap lines. The area of potential effect (“APE”) for aboveground historic resources includes areas adjacent to the ROW where visual impacts may occur. The APE for archaeological resources is defined as any areas of ground disturbance that may occur as a result of implementing the Project.

As part of the due diligence review, SWCA conducted a review of the MHC’s Inventory of Historic and Archaeological Assets of the Commonwealth using the Massachusetts Cultural Resource Information System (“MACRIS”) for the Massachusetts portion of the Project in June and July 2020. Records were searched for cultural resources within 1 km of the A1/B2 centerline within Massachusetts, as well as 1 km from the centerline of the tap lines. National Register of Historic Places (“NRHP”) files were also checked for the Project municipalities to identify any listed properties located in or near the A1/B2 Lines. Locational information from the files was cross-checked against SHPO maps, and those locations were confirmed using Google Earth (2020) imagery. The file review included both historic aboveground resources and archaeological resources that are listed or evaluated as eligible for listing in the State and National Registers of Historic Places, as well as surveyed properties that have not been evaluated or listed. Cultural resource management reports and town histories and historic maps salient to the Project study area were also consulted.

Based on the results of the cultural resources due diligence, SWCA recommended conducting an archaeological sensitivity assessment along the A1/B2 Lines to define areas of high archaeological sensitivity that might be impacted by the proposed work. The sensitivity assessment was completed on January 6, 2021 and formed the basis for developing a field testing plan related to the structure replacement locations. SWCA developed a research proposal based on the background research and sensitivity assessment, which was submitted to the MHC in April 2021.

Archaeological survey fieldwork for the Project structure replacement portion was conducted between June 28 and September 1, 2021, in Massachusetts. Additional fieldwork was conducted on December 6, 2021. Testing consisted of excavating 1,501 50-x-50- cm test pits 1,094 of which were in Massachusetts. In total, 150 pieces of cultural material were recovered (11 Native American and 139 Historic period), of which 142 came from Massachusetts. Five (5) archaeological resources were identified. Four (4) sites were identified in Massachusetts: three (3) pre-contact and one (1) post-contact. None of the sites in Massachusetts are considered significant and no further survey was recommended.

Additional testing was completed in 2022 for proposed new and/or re-established access roads. This additional field testing was sent in a research proposal to MHC on March 28, 2022. MHC modified permit #4001 to include the access road testing on April 8, 2022.

SWCA will submit the archaeological locational survey technical report to the MHC in October 2022. Should any archaeological site examinations be recommended, an additional research proposal will be submitted to the MHC at that time.

7.0 CLIMATE CHANGE ADAPTATION AND RESILIENCY

NEP has taken steps to promote climate change adaptation and resiliency in the design of the Project and continues to consider climate change and long-term infrastructure resiliency an important goal in its long-term infrastructure planning. The Project will result in a more climate-ready and resilient transmission system that can withstand more extreme weather events; address existing system capacity shortages and increased demand; and support future interconnections from renewable energy projects. In addition, the Project uses substantial portions of an existing ROW, thereby minimizing alteration of new land resources to construct the Project. The purpose of the Project is to address existing asset conditions along the A1/B2 Lines that pose a threat to electrical reliability.

The system upgrades, as proposed, are intended to help ensure the long-term longevity and reliability of the region's electrical infrastructure in the face of growing demand and the changing climate. The proposed upgrades to the A1/B2 Lines, the Athol, Crystal Lake and East Westminster Taps and access road improvements will weatherize this energy infrastructure and provide high speed communications between substations which will improve outage response times and help protect communities from blackouts during severe weather events.

The proposed Project has been designed in alignment with NEP's reliability goals and strategies in the following ways:

- Incorporates new design standards and the latest in design;
- Provides needed upgrades to existing electric transmission infrastructure;
- Provides the shortest project delivery time to meet the identified needs;
- Minimizes impacts to natural and social environments; and
- Provides a stronger electrical transmission system, vital to the public's safety, security and economic prosperity.

7.1. MEASURES TO ADAPT THE PROJECT TO CLIMATE CHANGE PER RMAT DESIGN STANDARDS

The Project has incorporated measures that seek to reduce potential vulnerability to anticipated climate risks and improve resiliency for future climate conditions. Governor Baker's Executive Order 569 (Order) set forth specific objectives to build resilience and adapt to the impacts of climate change in the Commonwealth. As part of the Order, the Executive Office of Energy and Environmental Affairs ("EOEEA") was instructed to produce the Massachusetts State Hazard Mitigation & Climate Adaptation Plan ("SHMCAP") (Plan). In addition to the Plan, the Order provides support to local and regional entities to develop action plans and implement priority projects via the Municipal Vulnerability Preparedness ("MVP") grant program. The predictive success of a project's improved resilience to climate change impacts is measured by the EEA Resilient MA Action Team's ("RMAT") Climate Resilience Design Standards Tool. The Plan states in its risk assessment, that, "in addition to increasing demand for heating and cooling, periods of both hot and cold weather can stress energy infrastructure...Electricity consumption during summer may reach three times the average consumption rate of the period between 1960 and 2000; more than 25 percent of this consumption may be attributable to climate change."²⁶

The Plan identifies that without reliable energy service, the basic needs of residents, visitors, businesses, and governments cannot be met. The Project, which is designed to improve reliable energy service within

26 EOEEA, 2011 as cited in Massachusetts State Hazard Mitigation and Climate Action Plan, 2018, p. 265. Retrieved 6/14/2022, <https://resilientma.org/shmcap-portal/static/media/SHMCAP-September2018-Full-Plan-web.286acceeb.pdf#page=90>

the region, serves this overall purpose. The Plan identified precipitation changes, sea level rise, rising temperatures, and extreme weather as the primary climate change interactions specific to regional power grid planning and incorporation of climate change data.

In accordance with the MEPA Interim Protocol on Climate Change Adaptation and Resiliency, NEP consulted the RMAT Climate Resilience Design Standards Tool for the Project. A copy of the output report generated by the RMAT tool (“RMAT Report”) is provided in *Appendix G*. A review of high-risk parameters related to Environmental Justice (“EJ”) Populations can be found in *Section 8.2.3*.

NEP considered each of these factors in designing the Project. NEP reviewed the RMAT Climate Resilience Design Standards Tool for climate projections, including coastal vulnerability, sea level rise and coastal flooding from the National Oceanic and Atmospheric Administration (“NOAA”) and temperature rise. However, the Project area is located outside of areas identified as vulnerable to sea level rise and coastal flooding. The Project is also designed to account for more frequent extreme weather events and extreme heat. The Project’s engineering design used structure loading criteria required by the National Electric Safety Code (“NESC”) and National Grid Design Loads for Overhead Transmission Structures. The NESC load criteria require consideration of combined ice and wind district loading, extreme wind conditions, and extreme ice with concurrent wind conditions. NEP’s standards also include consideration and contingency for heavy load imbalances and heavy ice conditions. All of these considerations result in a design that is better equipped to withstand extreme weather. The design incorporates materials (including steel structures and state of the art conductors) that have long useful lives and respond well to corrosive environments. The Project is also equipped to respond to increases in temperature. The new transmission line conductors are designed to operate at higher maximum operating temperatures at a higher carrying capacity and under fluctuations in air temperature.

The Project also contributes to regional climate resilient adaptation strategies for all the municipalities that the Project passes through. The RMAT Report documents the vulnerability of existing aging infrastructure and identifies key strategies to alleviate these vulnerabilities, including repair, upgrades and reuse and timely maintenance. Additionally, Project activities such as construction of access roads, work envelopes and installation of concrete caisson foundations will be required in floodplains. Design standards subject to floodplain will be followed during construction and the Project will meet the performance standards set forth by the state to ensure there are no impacts to climate change. The Project will result in a stronger electrical transmission system that is vital to the area’s safety, security, and economic prosperity.

7.2. CONSIDERATION OF ALTERNATIVE LOCATIONS AND DESIGN STRATEGIES IN LIGHT OF CLIMATE CHANGE

For the reasons described in *Section 2.0*, the Project team concluded that the proposed Project location is the only location that meets the identified Project need and reliability, addresses the various regulatory objectives, minimizes environmental impacts, and provides a cost-effective solution to customers.

8.0 ENVIRONMENTAL JUSTICE

8.1. INTRODUCTION

This section reviews the Project’s potential impacts on the EJ Populations pursuant to Section 58 of Chapter 8 of the Acts of 2021. The assessment has been prepared following the latest MEPA Protocol for Analysis of Impacts on Environmental Justice Populations (hereinafter, “MEPA Protocol for Analysis of EJ Impacts”) that addresses and enhances public involvement.

NEP conducted analysis on EJ communities within a distance of 1-mile (i.e. the Designated Geographic Area (“DGA”) of the Project. Within a 1-mile radius of the Project route, NEP identified 18 EJ Populations distributed in five (5) municipalities, including Gardner, Athol, Fitchburg, Leominster, and Lancaster. In total, Gardner, Athol, Fitchburg, Leominster, and Lancaster have 79.80%, 42.90, 72.90%, 67.10% and, 39% of the population living in an EJ Population, respectively. Additionally, as per the DPH EJ Tool, the total percentage of the communities of color in these five (5) municipalities are 9.90%, 18.0%, 37.70%, 30.70%, and 18.6%, respectively. Based on the MA DPH EJ Tool analysis, NEP identified populations that met the EJ criteria of income, minority, and minority and income within the designated geographical area. No English Isolation EJ Populations were identified within the designated geographical area; however, one EJ Population in Leominster (Block Group 2, Census Tract 7092.02) was identified to have 5% or more of the population who do not speak English very well.²⁷ This population was identified as having 7.7% of the population speaking Spanish or Spanish Creole. Additionally, NEP found that the median household income of the EJ Populations is \$44,659 in Leominster and \$44,659 in Gardner (MADPH, April 26).²⁸ *Table 21* summarizes all of the EJ populations, their EJ criteria, population and median income within the 1-mile designated geographical area and Census Tract. Additionally, NEP identified 65 EJ communities present within the 5-mile radius of the designated geographical area.

8.1.1 Public Involvement

Per 301 CMR 11.05(4)(b), Advance Notification of the Project was sent via electronic mail on June 14, 2022, by BSC to all contacts on the EJ Reference List, provided by the MEPA Office on February 23, 2022.

The Advance Notification consisted of the EJ Screening Form, as provided by the MEPA Office in the Public Involvement Protocol; a copy is provided in *Appendix H*. Efforts were made to ensure that language in the EJ Screening Form was understandable to the reader; that is, “technical” language was replaced with plain language, and legal jargon was omitted to the extent feasible.

NEP has undertaken measures to incorporate community involvement into the MEPA process. These community engagement strategies were determined based upon existing NEP stakeholder outreach methods and community engagement strategies provided in the Public Involvement Protocol. These involvement methods were discussed and supported by the MEPA Office during a Pre-Filing Consultation held on April 7, 2022.

A public website, available in Spanish and English, is available which provides details of the Project, an interactive mapper, and contact information for review. This website address²⁹ was also provided on the EJ Screening Form. Additionally, NEP hosted a virtual public meeting on July 11, 2022; information pertaining to this meeting was advertised in the Athol Daily News, Sentinel & Enterprise (Fitchburg and Leominster), Gardner Magazine and The Gardner News, Lancaster Online, Winchendon Courier, W

²⁷ Data for languages spoken was obtained from the American Community Survey 2011-2015 5-year estimates, Table B16001.

²⁸ MADPH (2022, April 26). *MA DPH Environmental Justice Tool*.

²⁹ Website address: www.newenglandA1B2.com

orcester Telegram & Gazette, and the Greenfield Recorder, and was also provided to the EJ Reference list via electronic mail and to the abutters of the A1/B2 Lines within EJ Populations via mail, see *Appendix H*. Repositories for hard copies of Project materials have been established at public libraries within each of the nine (9) municipalities within the Project Site in the Commonwealth of Massachusetts, which will be updated regularly as additional Project documents become available. NEP has established a Project-specific email address (info@newenglandA1B2.com) for community members to ask any remaining questions they may have,

As noted above, no English Isolation EJ Populations were identified within the designated geographical area; however, one (1) EJ Population in Leominster was identified to have 5% or more of the population who do not speak English very well. Additionally, NEP contacted the municipalities within 5-miles of the Project to confirm that the languages spoken other than English were limited to Spanish. Given this information, the EJ Screening Form, meeting invitation and meeting invitation advertisement were translated into Spanish. Interpretation services were provided at the public meeting.

NEP will maintain the distribution list of contacts from the EJ Reference List and any additional contacts that are identified during the virtual meetings and public engagement process. Contacts will receive notifications of the MEPA site visit, summaries of supplemental information submitted to the MEPA office and any other relevant notices or materials issued during the course of the MEPA review.

Table 21: Massachusetts Department of Public Health (DPH) EJ Communities (1- Mile)³⁰

Municipality	Census Tract	Category	Minority Population	Median Income
GARDNER	Block Group 1, 7075	Income	13.9 %	\$56,023
	Block Group 3, 7075	Minority	34.3 %	\$80,221
	Block Group 1, 7072	Income	18.4 %	\$32,746
	Block Group 3, 7073	Minority and Income	40.4 %	\$40,486
	Block Group 1, 7073	Income	21.4 %	\$42,608
	Block Group 2, 7073	Income	14.30%	\$44,659
	Block Group 2, 7074	Income	17.50%	\$51,635
	Block Group 2, 7075	Minority	32.9 %	\$63,401
	Block Group 1, 7071	Income	0.6 %	\$41,397
	Block Group 3, 7075	Minority	34.3 %	\$80,221
ATHOL	Block Group 1, 7033	Income	3.50%	\$42,292
	Block Group 2, 7031	Income	5.50%	\$43,938
	Block Group 1, 7031	Income	8.4 %	\$35,556
	Block Group 3, 7032	Minority	33.40%	\$0
FITCHBURG	Block Group 2, 7103	Minority	27.50%	\$62,353
LEOMINSTER	Block Group 2, 7092.02	Minority and Income	40.4 %	\$44,659
	Block Group 1, 7092.02	Minority	32.6 %	\$59,896
	Block Group 3, 7092.01	Minority and income	30.3%	\$55,938
LANCASTER	Block Group 4, 7131	Minority	29.6 %	\$95,278

8.2 ASSESSMENT OF EXISTING UNFAIR OR INEQUITABLE ENVIRONMENTAL BURDEN

8.2.1 Vulnerable Health Criteria

This section outlines the assessment of existing unfair or inequitable environmental burden, pre-consultation process, including surveys and interaction amongst community-based organizations (“CBOs”), tribes, or other residents, Massachusetts Department of Public Health (“DPH”) EJ Tool survey, assessments on vulnerable health EJ criteria, and assessments conducted to date, including potential impacts to the EJ population, and proposed mitigation measures. The DPH’s Bureau of Environmental Health worked with the Massachusetts Executive office of Energy and Environmental Affairs (EOEEA) to identify four (4) environmentally related health indicators to identify populations and communities with higher-than-average rates of environmentally related health outcomes. The four (4) vulnerable health criteria

³⁰ Data was obtained from <https://www.mass.gov/info-details/massgis-data-2020-us-census-environmental-justice-populations>

include: Low Birth Weight Rate, Pediatric Asthma Ed Visits Rate per 10,000, Heart Attack Rate, and Lead Poisoning Rate for each census tract and municipality.³¹ Vulnerable health criterion is defined as environmentally related health indicators that are measured to be 110% above state-wide averages.

The first part of the assessment analyzes the area around the Project for the potential for state listed environmental justice communities along the proposed route. NEP reviewed MA DPH Environmental Justice Tool data layers and solicited database information available on their website. Using the DPH EJ Tool, EJ Populations within 1-mile of the Project (“Designated Geographic Area”) that exhibit one (1) or more of the four (4) specific “vulnerable health criteria” were identified. As a result of the MEPA Protocol for Analysis of EJ Impacts Requirements/Procedure and MA DPH Environmental Justice Tool³², it was determined that all municipalities present in the designated geographic area meet at least one (1) Vulnerable Health EJ Criteria. The assessment concluded that the designated geographical areas exhibit “vulnerable health EJ criteria,” and therefore, potentially bear an unfair or inequitable environmental burden and related public health consequences. See *Table 22* below.

Table 22: Vulnerable Health EJ Criteria (1 - Mile) (rounded to tenth)

Municipality	EJ and Vulnerable Health EJ Criteria Status	Vulnerable Health Topic EJ Criteria Met	Statewide Rate per 1000 ³³
GARDNER	Meets at least one Vulnerable Health EJ Criteria	Low Birth Weight Rate per 1000	216.8
		Pediatric Asthma Ed Visits Rate per 10,000	83.1
		Heart Attack Rate per 10,000	26.4
		Lead Poisoning Rate per 1,000	17.6
ATHOL	Meets at least one Vulnerable Health EJ Criteria	Pediatric Asthma Ed Visits Rate per 10,000	83.1
		Lead Poisoning Rate per 1,000	17.6
		Low Birth Weight Rate per 1,000	216.8
		Heart Attack Rate per 10,000	26.4
FITCHBURG	Meets at least one Vulnerable Health EJ Criteria	Low Birth Weight Rate per 1,000	216.8
		Lead Poisoning Rate per 1,000	17.6
		Heart Attack Rate per 10,000	26.4
		Pediatric Asthma Ed Visits Rate per 10,000	83.1

31 Four vulnerable health EJ criteria are tracked in the DPH EJ Viewer, of which two (heart attack hospitalization and childhood asthma) are tracked on a municipal level, and two (childhood blood lead, and low birth weight) are tracked on a census tract level.

32 <https://matracking.ehs.state.ma.us/Environmental-Data/ej-vulnerable-health/environmental-justice.html>

33 Five-year average that is equal to or greater than 110% of the state rate.

LEOMINSTER	Meets at least one Vulnerable Health EJ Criteria	Pediatric Asthma Ed Visits Rate per 10,000	83.1
		Heart Attack Rate per 10,000	26.4
		Lead Poisoning Rate per 1,000	17.6
		Low Birth Weight Rate per 1,000	216.8
LANCASTER	Meets at least one Vulnerable Health EJ Criteria	Pediatric Asthma Ed Visits Rate per 10,000	83.1
		Lead Poisoning Rate per 1,000	17.6
		Heart Attack Rate per 10,000	26.4

8.2.2 Additional DPH Tool

NEP identified additional potential sources of pollution within the municipalities in the designated geographic area that could be contributing to the existing unfair or inequitable environmental burden and related public health consequences. Of the 18 EJ Populations in the designated geographic area, 10 EJ Populations, within five (5) municipalities were found to have potential sources of pollution. Pollution sources reviewed consist of air operating permits, large quantity generators, M.G.L. C. 21E Sites, Tier II Toxics use reporting facilities, MassDEP sites with AULs, MassDEP groundwater discharge permits, wastewater treatment plants, MassDEP public water suppliers, underground storage tanks, EPA Facilities, and Energy generation and supply.

Lancaster

In Lancaster, Block Group 4, Census Tract 7131, seven (7) potential pollution sources were identified. In total, there are three (3) underground storage tanks, and one (1) M.G.L. C. 21E Site, wastewater treatment plant, MassDEP public water supplier, and EPA Facility (See *Table 23*).

According to NEP's survey on enforcement histories, there were two (2) facilities that received documented enforcement including the Lancaster Water Department and MCI Shirley Department of Corrections. The Lancaster Water Department (MassDEP public water supplier) has a history of 18 enforcements issued from 1996 to 2016 (See *Appendix H*). MCI Shirley Department of Correction (underground storage tank) has a history of seven (7) enforcements from 2011 to 2018, within one (1) penalty, a fine of \$500 (See *Appendix H*).

Leominster

In Leominster, Block Group 2, Census Tract 7092.02, one (1) underground storage tank was identified as a potential source of pollution (See *Table 23*).

According to NEP's survey on enforcement histories, Speedway 2431 was found to have a record of two (2) enforcements issued in 2011 and 2019 with no penalty assessed (See *Appendix H*).

Fitchburg

In Fitchburg, Block Group 2, Census Tract 7103, 32 potential pollution sources were identified including two (2) air operating permits, two (2) large quantity generators, four (4) large quantity toxic user, four (4) M.G.L. C. 21E Sites, seven (7) Tier II Toxics use reporting facilities, three (3) MassDEP sites with AULs,

one (1) wastewater treatment plant, six (6) underground storage tanks, two (2) EPA Facilities, and one (1) Energy generation and supply (See *Table 23*).

According to NEP's survey on enforcement histories there are 10 Individuals/Facilities that comprise the potential pollution sources. These facilities are:

- 431 Westminster St LLC (Air permit, Large quantity toxic user)
- Newark America (Air permit, Large quantity toxic user, "Tier II" toxic use reporting facility, EPA Facility)
- Omnova Solutions Inc. (Large quantity toxic user, "Tier II" toxics use reporting facilities, underground storage tank, EPA facility)
- Modu Form Inc. (Large quantity toxic user, "Tier II" toxics use reporting facility)
- Avery Dennison ("Tier II" toxics use reporting facility)
- Chemdesign Corp (AUL, Underground storage tank)
- Montachusett Regional Vocational School (Underground storage tank)
- Fitchburg Wastewater West Plant (Underground storage tank)
- Cristy Corporation (Underground storage tank)
- Booster Pump Station (Underground storage tank).

431 Westminster St LLC has a history of three (3) enforcements with no penalty assessed from 2000 to 2009. Newark America has a history of three (3) enforcements from 2001 to 2008, with a penalty assessed in 2005 with a fine of \$19,900. Omnova Solutions Inc. has a history of five (5) enforcements from 2002 to 2021, with a penalty assessed in 2002 with a fine of \$21,500. Modu Form Inc. has a history of four (4) enforcements from 1996 to 2014, with two (2) penalties assessed. One (1) in 1996 for \$500, and one (1) in 2000 for \$9,250. Avery Dennison has a history of three (3) enforcements from 2001 to 2015 with no penalties assessed. Chemdesign Corp has a history of four (4) enforcements with no penalties assessed from 2002 to 2013. Montachusett Regional Vocations School has a history of five (5) enforcements from 2009 to 2017, with one (1) penalty assessed in 2010 for \$500. The Fitchburg Wastewater West Plant has a history of three (3) enforcements from 2011 to 2014, with one (1) penalty assessed in 2014 for \$500. The Cristy Corporation has a history of one (1) enforcement in 2011 with no penalty assessed. Lastly, the Booster Pump Station has a history of three (3) enforcements with no penalties assessed from 2011 to 2016. (*See Appendix H*).

Gardner

In Gardner, Block Groups 1, Census Tract 7075, contains eight (8) potential pollution sources, Block Group 2 contains five (5) potential pollution sources, and Block group 3 contains four (4) potential pollution sources. In Block Group 1, four (4) Tier II Toxics use reporting facilities, one (1) wastewater treatment plant, one (1) MassDEP public water supplier, one (1) underground storage tank, and one (1) energy generation and supply (See *Table 23*). In Block 2, one (1) large quantity generator, one (1) Tier II Toxics use reporting facility, one (1) underground storage tank, one (1) EPA facility, and one (1) energy generation and supply were identified (See *Table 23*). In Block 3, one (1) large quantity generator, and two (2) underground storage tanks were identified (See *Table 23*).

According to NEP's survey on enforcement histories there are five (5) Individuals/Facilities that comprise the potential pollution sources. These facilities are:

- Heywood Hospital ("Tier II" toxics use reporting facility, Underground storage tank)
- Gardner Water Department (Wastewater treatment plant, "Tier II" toxics use reporting facility, MassDEP public water supplier)

- Vivitide, LLC (Large quantity generator, EPA facility)
- North Central Correctional Institution (Underground storage tank)
- Gardner Stop & Buy (Underground storage tank).

Heywood Hospital has a history of 10 enforcements from 1997 to 2021, with four (4) penalties assessed for a total of \$2,500. The Gardner Water Department has 17 enforcements from 1996 to 2022, with no penalties assessed. Vivitide LLC, has three (3) enforcements from 2006 to 2021, with one (1) penalty assessed for \$9,000. North Central Correctional Institution has a history of five (5) enforcements from 1996 to 2021, with no penalties assessed. Lastly, the Gardner Stop & Buy has a history of 12 enforcements from 2006 to 2018, with six (6) penalties assessed for a total of \$4,000 (*See Appendix H*).

Athol

In Athol, Census Tract 7031, Block Groups 1 and 2, each have 12 potential pollution sources, and Block Group 1, Census Tract 7073 and Block Group 3, Census Tract 7032 have nine (9) and two (2) potential pollution sources, respectively. In Census Tract 7031, Block Groups 1 and 2, there are two (2) Tier II Toxics use reporting facilities, four (4) MassDEP sites with AULs, one (1) wastewater treatment plant, three (3) underground storage tanks, and two (2) EPA facilities. (*See Table 23*).

According to NEP's survey on enforcement histories there are seven (7) Individuals/Facilities that comprise the potential pollution sources. These facilities are:

- Getty Petroleum Marketing Inc. (Underground storage tank)
- Girardi Distributors Corp (Underground storage tank)
- Pexco LLC (EPA Facility)
- Speedee Oil Change & Tune-Up (Large quantity generator, Underground storage tank)
- Cumberland Farms 2468 (Underground storage tank)
- Athol Memorial Hospital ("Tier II" toxics use reporting facility, Underground storage tank)
- Peterborough Oil Company ("Tier II" toxics use reporting facility, Underground storage tank).

Getty Petroleum Marketing Inc. has a history of three (3) enforcements from 2016 to 2019, with one (1) penalty assessed in 2019 for \$500. Cumberland Farms 2143 has a history of one (1) enforcement in 1997 with no penalty assessed. The Girardi Distributors Corp has a history of three (3) enforcements from 2016 to 2020 with no penalties assessed. Pexco LLC has a history of three (3) enforcements from 1997 to 2004; in 1997 a penalty of \$4,000 was assessed. Speedee Oil Change and Tune-Up has a history of two (2) enforcements from 2006 and 2008 with no penalties assessed. Cumberland Farms 2468, Athol Memorial Hospital and Peterborough Oil Company have all received one (1) enforcement with no penalty assessed in 2005, 2015 and 2006, respectively (*See Appendix H*).

Table 23: Other Potential Sources of Pollution within EJ Boundaries (1 - Mile)

Municipality	EJ Census Tracts	Air Operating Permits	Large quantity generators	Large quantity toxic user	M.G.L. c. 21E Sites	“Tier II” toxics use reporting facilities	MassDEP sites with AULs	MassDEP groundwater discharge permits	Wastewater treatment plants	MassDEP public water suppliers	Underground storage tanks	EPA facilities	Energy generation and supply	Total

8.2.3 RMA Tool High-Risk Rating Parameters

This section reviews the Project's potential temporary and permanent climate change impacts on the EJ Populations. The assessment has been prepared by running preliminary climate change exposure and risk rating Project inputs on the RMA tool. The RMA is tasked with monitoring and tracking the State Hazard Mitigation and Climate Adaptation Plan ("SHMCAP") implementation process, making recommendations to and supporting agencies on plan updates, and facilitating coordination across State government and with stakeholders, including municipalities, and businesses. The guidelines provided by the tool are structured around three categories - site suitability ("SS"), regional coordination ("RC"), and flexible adaptation pathways ("AP"). These categories assess the adverse climate change impacts of the Project assets on the local and regional level, while also projecting future capacity and design for uncertainty and vulnerabilities to the climate from the Project.

The RMA tool runs the Project asset impacts and generates an overarching climate risks analysis based on three variables: sea level rise and storm surge, extreme precipitation including urban flooding and riverine flooding, and extreme heat. According to the preliminary analysis, the Project is not exposed to sea level rise/storm surge.

The Project asset risk related to extreme heat is high (Tier 3) within all EJ Populations. The Project risk is at high exposure to extreme heat because the Project is not located within 100-ft of an existing water body and activities include tree removal. In addition, the Project's high exposure to extreme heat is because the existing ROW's canopy cover is approximately 10% to 40% of the ROW area. and the Project requires 164 acres of the existing canopy cover to be removed to comply with Transmission Lines Design Standard requirements. The ROW will be maintained as a vegetated corridor with no new impervious development capacity beyond the Project scope, thereby mitigating any additional risk of extreme heat and heat islanding. Notwithstanding the Project location and canopy reduction requirements; the improvements to the conductor capacity proposed among the Project objectives establishes a more resilient and qualified energy delivery service during times of high usage, such as extreme heat events, which are anticipated to increase in frequency due to climate change.

Similarly, the Project asset risk related to extreme precipitation - riverine flooding is high in all EJ Populations except in one (1) EJ Population in Leominster. The high exposure to extreme precipitation - riverine flooding is due to the Project location's history of riverine flooding. The Project is within 500-ft of a waterbody and less than 20-ft above the waterbody. The moderate exposure in one (1) of the sites in Leominster is due to the location of the EJ Population. The section of the ROW that goes through this specific EJ Populations is not within a mapped FEMA floodplain [outside of the Massachusetts Coast Flood Risk Model (MC-FRM)] and the Project is more than 500-ft from a waterbody.

Lastly, the Project asset risk related to extreme precipitation - urban flooding is high in all EJ Populations except in two (2) of the EJ Populations, one (1) in Leominster and one (1) in Gardner where the exposure is moderate. The Project has high exposure to extreme precipitation - urban flooding because the maximum annual daily rainfall exceeds 10 inches within the overall Project's useful life, and the existing impervious area of the ROW is between 10% and 50% of the total area. Similarly, the Project has moderate exposure to extreme precipitation - urban flooding in two EJ Populations, one (1) in Leominster and one (1) in Gardner, because the existing impervious area of the Project site is less than 10%.

State, federal, and local regulations will be followed to address all impacts caused during construction, and compensatory flood storage will be provided in accordance with the WPA Regulations for any proposed fill in BLSF.

8.2.4 Feedback from Public Meeting Pursuant to MEPA EJ Public Involvement Protocol

No issues or concerns were raised during the virtual public meeting on July 11, 2022.

8.3. ANALYSIS OF PROJECT IMPACTS TO DETERMINE DISPROPORTIONATE ADVERSE EFFECT

8.3.1. Nature and Severity of Project Impact

The Project will occur within the existing ROW, thereby minimizing adverse environmental impacts. Due to the nature of the Project, outage constraints in the region, and NEP's efforts to reduce impacts to the natural and human environment, Project activities will be sequenced in both the mainline and tap lines. No long-term impacts on soil, bedrock, vegetation, surface water, groundwater, wetland resources or air quality will occur. Any potential sedimentation impacts, and other short-term construction impacts to wetlands and surface waters, will be mitigated through the use of soil erosion and sediment control BMPs and temporary construction mats to protect wetland soils, vegetation root stock, and streams. As part of the Project, an environmental monitor will be part of the Project team to ensure compliance with all regulatory programs and permit conditions, and to oversee the proper installation and maintenance of the soil erosion and sediment control BMPs. Because the nature and severity of project impacts are minimal on all populations, including EJ populations, the Project will not materially exacerbate any existing unfair or inequitable environmental or public health burden impacting the EJ population.

8.3.1.1. Potential Environmental and Public Health Impacts and Proposed Mitigation

Potential environmental and public health impacts of the Project and anticipated mitigation include the following:

Air Quality

Construction-period activities, such as grading, road building, vehicle travel, and other earth-disturbing work may result in a temporary increase in airborne dust. Impacts to air quality will be minimized by managing the control of dust movement with practices such as spreading wood mulch or straw and using water trucks to spray dried soil to keep it moist. The potential for dust generation is only anticipated during the construction period. Post construction, soil will be stabilized and re-vegetated.

In addition, diesel-powered equipment is required to use ultra-low sulfur diesel fuel. Any diesel-powered non-road construction equipment rated 50-horsepower or more that will be used on the Project for 30 days or more will be required to install emission control devices. The impacts from these emissions will be minimal and are not anticipated to cause impacts to public health. Additionally, idling times are limited to five (5) minutes except when engine power is necessary for the delivery of materials or to operate accessories to the vehicle such as power lifts. Vehicle idling is to be minimized during construction activities and be in compliance with the Massachusetts Anti-idling Law, G.L. c. 90 § 16A, c. 111 §§ 142A – 142M, and 310 CMR 7.11.

Water Quality

The Project will incorporate protective and preventative measures to minimize and avoid impacts to water quality. The ROWs cross many wetland areas, streams and rivers. To protect water quality and these sensitive areas, temporary roads will be constructed using construction mats which will be removed following the completion of construction and the wetlands will be restored. In addition, BMPs, such as the use of straw wattles, silt fencing, stormwater management features, and other control measures will be used to prevent soil and other material from being transported into wetlands and streams. Using these BMPs, any impacts to water quality will be negligible and temporary and are not anticipated to cause impacts to public health.

Land Protection and Open Space

There is one (1) EJ Population with Municipal Open Space (Gardner Municipal Golf Course) within the Project ROW specifically, Block Group 1, Census Tract 7075 in Gardner. Access to the golf course will not be impacted by the Project since the activities will be limited to within the existing ROW.

The A1 and B2 Lines pass through several State Forests owned and maintained by DCR. There is one (1) EJ Population within the Project ROW, Block Group 2, Census Tract 7103, located within a DCR Property (Leominster State Forest). This property does not have access roads, trails, or parking for public access. Additionally, Project activities will be limited to the existing ROW. Access to Protected Land and Open Space within EJ Populations will not be impacted.

Noise

The EJ Populations that are most likely to have temporary noise impacts are the communities that are directly within or are located near the ROW. The EJ Populations that have relatively dense development are Block Group 1, Census Tract 7075 in Gardner and Block Group 1, Census Tract 7031 in Athol. The EJ Population in Athol is approximately 100-ft from the Athol Tap Line, whereas the ROW goes through the EJ Population in Gardner. Noise impacts associated with construction-period activities are temporary in nature and expected to be minimal. Where construction will occur adjacent to residences, NEP will notify landowners prior to the commencement of work. Noise-generating activities will be conducted in accordance with any local and state requirements and are not anticipated to cause impacts to public health.

Traffic

Impacts to traffic during the construction of the Project will be minor and intermittent. The work areas will be accessed primarily from NEP-owned access routes or minor town roadways. Within Block Group 2, Census Tract 7103 in Fitchburg, temporary access off Route 2 will be required. NEP will obtain the necessary permits from MassDOT for access. Once on-site, vehicle traffic will be limited to within or in proximity to the ROW. Since the ROW is an un-manned facility, there will be no permanent impacts to traffic patterns or use of existing roadways and no impacts to public health are anticipated from traffic post-construction.

NEP anticipates no long-term construction impacts as the Project will occur within the existing ROW. Any short-term construction impacts will be mitigated through the use of BMPs and completed in accordance with any local, state, and federal regulations.

8.3.2 Comparable Impacts on EJ and Non-EJ Populations

The MEPA Protocol for Analysis of EJ Impacts states that “the Proponent should also analyze whether the impacts on the EJ population are greater or less than those on non-EJ populations. The purpose of this analysis is to assess whether the project is adding impacts to an already burdened area in a “targeted” way that is disproportionate when compared to non-EJ populations.” Due to the nature of this project, there is no disproportionate impact on EJ populations within the DGA.

The Project generally minimizes impacts on all populations by refurbishing an existing line within an existing transmission line corridor. Because of this, the Project does not result in any significant long-term environmental or public health impacts for any population, including EJ populations. Impacts from construction are temporary and insignificant. They will not result in any public health impacts to any population. Other impacts, such as temporary impacts to wetlands, do not directly affect any population or affect any populations disproportionately.

8.3.3. Project Benefits

The Project will benefit from an increased reliability of the overall transmission line by refurbishing the existing structures and wire. On more robust structures and higher strength conductor will be installed which are better suited to withstand storm events and are less prone to experiencing line outages. The new overhead lines will be larger which will allow more electricity to flow during times of high usage, such as extreme heat events, which are anticipated to increase in frequency due to climate change. The installation of OPGW will allow better communication between substations, resulting in improved response time during storm-related emergencies and outages, which will increase public safety.

Other benefits of this Project that are not expressly stated includes the reduction of an overall disturbance to adjacent landowners, wetland resource areas, and rare species habitat over time by planning for the future and reducing the likelihood of multiple repeat projects, thereby reducing environmental impacts, and reducing costs to NEP's customers. Addressing the climate change crisis requires a major expansion of renewable energy and the infrastructure necessary to support and deliver that energy. NEP is actively taking steps to ensure that its system is ready to meet this critical challenge. Replacing infrastructure like the A1/B2 Lines helps to accomplish this goal. The replacement lines will have higher kV ratings that will support higher volumes of currently active and forecasted renewable energy resources in this region. This longer-term view is supported by the recently shared initial results of the ISO-NE 2050 study, where an upgrade to 115 kV would be necessary based on the current study assumptions and long-term forecasts for the Commonwealth. Furthermore, the replacement of the Lines will have the added benefit of allowing significantly more renewable energy resources to connect into the system if and when the lines are operated at 115kV. 115kV operation will require work at substations along these lines before it can be implemented. Overall, the Project will improve transmission system infrastructure and comply with comprehensive regional plans for improving electric transmission reliability in New England, for EJ and Non-EJ Populations alike. No long-term impacts on soil, bedrock, vegetation, surface water, groundwater, wetland resources or air quality will occur as a result of this Project. Throughout construction, mitigation measures will be implemented effectively to minimize Project impacts on the environment.

Following the completion of construction, NEP uses standard mitigation measures on all transmission line construction projects to minimize the impacts of projects on the natural environment. These measures include revegetation and stabilization of disturbed soils, ROW vegetation management practices, and vegetation screening maintenance at road crossings and in sensitive areas. Other measures are used on a site-specific basis. NEP will implement standard and site-specific mitigation measures for the Project.

As discussed above, short-term construction related impacts are not anticipated to adversely affect EJ Populations as BMPs will be implemented and construction will follow federal, state and local construction requirements. The Project is not anticipated to result in increased health burdens considered in the vulnerable health criteria. The Project will not result in a new potential pollution source, or negatively impact the environment to further burden the EJ Populations that are affected by current pollution sources. Lastly, there is not a significant disproportionate effect identified with 10% of Project impacts located within the EJ Populations, which represents 10% of the Project ROW, whereas 90% of Project impacts are within non-EJ Populations, which represents 90% of the Project ROW. Therefore, it is the opinion of NEP that the Project will not have unfair or inequitable impacts on the EJ Populations within the designated geographic area.

8.3.4. ANALYSIS OF PROJECT IMPACTS TO DETERMINE CLIMATE CHANGE EFFECTS

The Project team has evaluated the project impacts in regard to Climate Adaptation and specifically the effect on EJ populations as directed by the MEPA protocol. The cities of Leominster, Gardner, and Athol include EJ populations within the DGA of the Project. The MEPA protocol requires evaluation with respect to sea level rise/storm surge and extreme precipitation (urban or riverine flooding), tree clearing and/or land use change (e.g., adding impervious area) and its effect on heat conditions in the area, or other climate related changes that could be affected by the Project.

Structures with concrete caisson foundations that are located within the 100-year flood zone could slightly impact flooding conditions have been evaluated along the ROW. There are several structures proposed with concrete caisson foundations located within the 100-year (i.e., 1% risk) flood zone based on review of available Flood Insurance Rate Maps (FIRMs); however, there are none located within the identified EJ population communities of Leominster, Gardner, and Athol. Compensatory flood storage will be provided as required by the WPA. Additionally, any work areas that will be constructed within the 100-year flood zone will be constructed using temporary timber matting and will not permanently impact the flood zone.

Additionally, access roads and work pads that will be created along the ROW to support construction will use pervious gravel and will include stormwater BMPs to manage and control stormwater runoff. The change from shrub vegetated landscape to gravel roads and work pads is not anticipated to significantly change drainage conditions along the ROW.

As described in section 8.2.3, the project asset risk to extreme heat was high within all EJ neighborhoods, per the RMAT tool. A driver of this risk score is removal of 164 acres of the existing canopy cover to comply with Transmission Lines Design Standard requirements. 24 acres (15% of project total) of tree removal will occur in EJ Census Blocks. An examination of the proposed conditions in all EJ neighborhoods reveals that one section of the ROW, approximately .31 miles long parallel to Park St. in Gardner, proposed tree removal intermittently extends to the existing tree line on the east side of some properties. Where this occurs, shade to these properties in the morning will be reduced, though not fully eliminated, and portions of the property near the ROW may experience a minor short-term increase in temperature. In contrast to these minor potential impacts, the Project provides substantial benefits through improvements to the conductor capacity which establishes a more resilient and qualified energy delivery service during times of high usage, such as extreme heat events, which are anticipated to increase in frequency due to climate change.

9.0 GREENHOUSE GAS PROTOCOL

9.1 INTRODUCTION

As part of the MEPA Greenhouse Gas (“GHG”) Protocol, the Executive Office of Energy and Environmental Affairs (“EOEEA”) requires a review of a Project’s potential for emission of greenhouse gases. The Greenhouse Gas Emissions Policy was included in the MEPA review process to fulfill the statutory obligation to take all feasible measures to avoid, minimize, or mitigate damage to the environment by the Project. The Policy requires Projects to undergo review by the MEPA office to quantify the Project’s GHG emissions, along with the impacts of proposed mitigation in terms of emissions and energy savings and identify measures to avoid, minimize, or mitigate such emissions. MEPA GHG Protocol provides guidance to projects that are subject to MEPA review without creating specific new regulatory requirements.

The Project does not have any emissions sources that require analysis under the GHG emission Quantification Protocol. However, the protocol provides the Secretary with discretion, on a case-by-case basis, to require GHG analysis of certain types of other project impacts, including projects that will result in alteration of land greater than 50 acres. If such an analysis is required, the protocol states that the Secretary will advise the proponent of this requirement in the Certificate on the ENF or EENF. In the Project pre-filing meeting, the MEPA Office indicated it would be requiring a GHG analysis of the tree removal aspects of the Project. The MEPA Office did not identify a methodology and NEP agreed to evaluate possible approaches and discuss them in the EENF. NEP is evaluating potential analysis approaches to meet MEPA’s requirement including field analysis, available datasets and research, and emissions mitigation evaluation. One potential analysis would include the following two steps:

1. Estimate the existing carbon stocks using height adjusted land cover values with LiDAR.

Estimation of above ground (trees) and below ground (roots) biomass applies average biomass carbon values for each land cover, as classified in the 2016 1-m High Resolution Land Cover layer. The biomass carbon values are derived from the best available datasets for New England land covers. To account for stand age and density, available LiDAR data would be used to calculate forest height and adjust against the average height of forest trees in the data sets used to assign biomass carbon values. Deviation from the average will be used as a factor to increase or decrease the value assigned to that portion of the land cover. To verify the GHG values, five (5) sample sites will be chosen to be evaluated in the field to confirm assumptions.

2. Carbon Flux Analysis.

Comparison between the existing and proposed land cover would be conducted by calculating the differential between existing carbon values and estimated carbon values taking into account soil type and proposed land cover. The flux would include sequestration rates and growth between the time of construction and the MEPA proposed time horizon of 2050.

10.0 GENERAL TRANSMISSION LINE CONSTRUCTION PROCEDURES

10.1 CONSTRUCTION PROCEDURES

The Project will adhere to conventional transmission line maintenance and construction procedures along with any agency requirements. These procedures are documented in EG-303NE (please refer to *Appendix C*), which outlines NEP policies for ROW access, maintenance and construction BMPs. By consistently implementing these procedures, NEP ensures that transmission lines are constructed by trained personnel in a manner that minimizes potential impacts to the environment, adheres to permit conditions, and meets industry standards. This section summarizes NEP policies and addresses Project-specific construction methods. The discussion presumes that all required permits and authorizations will have been issued, and that throughout construction appropriate consideration will be given to Project implementation in a manner consistent with conditions of permits/authorizations and approved mitigation measures.

10.2 ENVIRONMENTAL COMPLIANCE AND MONITORING

Project activities will be overseen by an “Environmental Monitor,” a qualified environmental professional designated by NEP who can capably monitor on-site construction conditions in relation to permit and regulatory requirements (see *Section 11: Regulatory Compliance*). In addition, NEP’s contractor will designate a Construction Supervisor who will be responsible for daily inspections of work areas during the construction period and will address potential issues related to the environment (i.e., erosion and sedimentation). The Construction Supervisor will be on-site daily to perform required inspections and has “stop work” authority if required due to an observed or reported infraction of the standards and procedures.

Documentation identifying deficiencies of sediment and erosion control measures will be forwarded to the construction supervisor for implementation of corrective measures. As a proactive approach to ensure compliance with environmental permit requirements, all construction personnel will be briefed on the Project’s environmental issues and permit obligations prior to construction. Field staff will also be trained to recognize and respond to changing field conditions as they relate to protecting sensitive areas, wetland resource areas and preventing sedimentation and stormwater runoff. Regular progress meetings will be held to reinforce contractor’s awareness of these issues.

Environmental Monitors will be responsible for monitoring work when activities occur within rare species habitat. Specific functions to be performed by the scientist will be defined during consultation with NHESP.

10.3 CONSTRUCTION STAGES

Once initiated, work will generally follow the sequence listed below. However, certain activities may occur simultaneously within one or more areas of the Project.

- Refreshment of flagging of wetland and other sensitive resources adjacent to work areas and access roads;
- Vegetation management
- Install BMPs;
- Construct, improve or re-establish access roads; maintain as necessary;
- Establish work envelopes;
- Install new/or replacement utility structures;
- Install OPGW/Replace shield wires;
- Remove existing and temporary structures;
- Restore the ROW, as necessary, including revegetation of disturbed areas resulting from the construction process to the greatest practicable extent; and dispose of existing line components;
- Conduct follow-up inspections, as required.

The following sections provide details for the transmission line construction activities.

10.3.1 Refreshment of Resource Area Flagging

Wetlands in the Project area have been delineated and are shown on the *MEPA General Purpose Plans presented in Appendix A: Figures*. Sensitive resources, e.g., rare species habitat and vernal pool habitat, have also been field-identified. Prior to the start of construction, these resources will be rechecked for accuracy and reflagged, as appropriate.

10.3.2 Establish Limit of Disturbance

It is anticipated construction activities and materials will be confined to the LOD as shown on the MEPA General Purpose Plans in *Appendix A*. Prior to the start of construction, these areas will be flagged, as appropriate. The LOD zone represents the additional work area beyond the limits of grading which is also shown on the MEPA General Purpose Plans in *Appendix A*. Within the LOD, equipment access, the placement of temporary BMPs, soil stockpiling and equipment maneuvering is anticipated. In addition, where applicable, tree removals are preliminarily assumed within the LOD zone due to the anticipated secondary impacts from grading activities. Temporary construction matting is assumed to be utilized where access is necessary in wetlands. NEP is working toward solutions to reduce the extent of the LOD throughout the Project ROW. NEP will coordinate with landowners as necessary for temporary construction access as the plans are refined.

Due to the land use constraints within Article 97 lands, construction access will be limited to the easement. These areas will be reviewed as the design advances and modifications to the design, such as adding additional retaining walls, may be necessary to stay within the confines of the easement.

10.3.3 ROW Clearing and Installation of BMPs

Following the ROW vegetation management activities, proper sediment and erosion control devices, such as straw wattles, silt soxx, straw bales, and siltation fencing, will be installed in accordance with approved plans and permit requirements (e.g., OOC), and overseen by NEP's Construction Supervisor. Weekly inspections to evaluate potential erosion and/or sedimentation issues will be conducted, and inspection reports will be submitted until "final stabilization" has been achieved (i.e., 70 percent vegetative cover or at least to pre-construction conditions within the disturbed areas). Photographic documentation will also be performed. The control devices will provide the dual function of mitigating construction-related erosion and sedimentation, as well as serving as a physical boundary to delineate resource areas and to contain construction activities within approved areas.

10.3.4 ROW Vegetation Management

To facilitate construction equipment access along the majority of the ROW and at structure sites, vegetative removal, will be undertaken in select areas, as necessary. This will be done to provide access to proposed structure locations to facilitate safe equipment passage, to provide safe work sites for personnel within the ROW, and to maintain safe and reliable clearances between vegetation and transmission line conductors. Additionally, disturbed areas would be allowed to revegetate with low growing scrub-shrub species, similar to existing vegetation within the maintained portions of the ROW.

As part of an IVM program, NEP's professional arborists oversee the use of mechanical, natural, and chemical (herbicide application) methodologies to effectively manage vegetation along the ROW. Vegetation maintenance of the ROW will be consistent with the approved VMP. Herbicides will be applied by licensed applicators to select target species. Herbicides are never applied in areas of standing water or within designated protective buffer areas associated with wells, surface waters, and agricultural areas. NEP currently utilizes a four- to five-year vegetation maintenance cycle on its transmission ROWs. NEP's ROW

vegetation maintenance practices encourage the growth of low-growing shrubs and other vegetation that provide a degree of natural vegetation control. Vegetation maintenance under and adjacent to the transmission lines and tap lines will be consistent with current ROW procedures. Vegetation management within sensitive areas, including NHESP-designated priority habitat, is outlined in the VMP.

10.3.5 Access Road Reestablishment and Improvements

Access roads along the ROW allow NEP and contractor personnel to construct, inspect, and maintain the existing and proposed transmission line facilities. After careful planning and field investigations, NEP has determined that the majority of the line requires establishing new or improving existing access roads. In locations where maintenance or upgrades are required to support construction activities, gravel may be added to provide a stable and level surface for construction vehicles. It may also be necessary to reestablish roads that were used for the installation and maintenance of the existing lines but have become overgrown. To be conservative, it is assumed that access roads will be maintained after they are improved or reestablished for the Project. NEP's actions and future maintenance of off-ROW access routes will be guided by agreements with individual property owners.

In planning for site access, consideration was given to avoiding the use of access roads within or adjacent to environmentally sensitive areas to minimize the potential impacts associated with construction activities. Due to the extensive wetlands located in portions of the ROW, access across wetland areas and streams could not be avoided. Where upland access is not available, vehicles and equipment will be accommodated by the temporary placement of construction mats. Temporary construction mat access roads will be removed following completion of construction.

Although construction mats displace the weight load of equipment, depressional grooves or furrows (i.e., rutting) in the wetland soil may still result. It is important to note that rutting is not the normal circumstance that results from the use of construction mats. The extent of this temporary impact is a direct function of many factors, including but not limited to soil texture; moisture content; type of construction mat; and time of year. If the rutting is greater than approximately six (6) inches deep, these areas will be re-graded (or backbladed) to reestablish the preexisting topography and maintain existing wetland hydrology. NEP will work with each community's Conservation Commission or authorized representative (i.e., Agent), as well as the USACE, to ensure that the area is in compliance with all performance standards in all applicable wetlands regulations as well as each OOC.

Access road construction will be carried out in compliance with the conditions and approvals of the appropriate federal, state and local regulatory agencies, including the NHESP and MHC. Exposed soils on access roads will be wetted and stabilized, as necessary, to suppress dust generation. Crushed stone aprons will be used at all access road entrances to public roadways to clean the tires of construction vehicles and minimize the migration of soils off-site.

Equipment typically used during the installation and maintenance of access roads will include dump trucks used to transport fill materials to work sites, and bulldozers, excavators, vibratory rollers, backhoes and graders which will be used to place fill materials or make cuts to achieve the proper access road profile. Throughout the Project, pick-up trucks will be used to transport crews and hand-held equipment to work sites. Low-bed trailers will be used to transport tracked and other off-road equipment, which cannot be operated on public roadways to the work site.

10.3.6 Establish Work Envelopes and Staging Areas for Construction

Construction work envelopes, pull pads, and guard structure work envelopes (locations to be determined) will support the equipment needed to complete the structure installation, replacement and improvements. Work envelopes and staging areas (*shown on MEPA General Purpose Plans*) are primarily within existing ROW, but work envelopes for structures 466, 467, 468, 469, 493, 502A, 503A, 504, 537-1, 539, (Westminster); 598, 550, 599, 606, 555, 607, 608, 556, (Leominster); 597, 598, 599, 600, 601 (Sterling); CHE 97, CHE 98, CHE 99 (Chestnut Hill SS, Athol), are partially or completely off the ROW.

Construction work envelopes will vary in size based on various factors, for example specific activities and equipment required at each location and topographical constraints. In general, the work envelopes have been designed to be up to approximately 157-ft by 80 to 100-ft depending on the width of the ROW and extent of grading required to create the level work area and provide adequate space for the typical construction associated with the project scope of work as shown on the MEPA General Purpose Plans.

The actual area needed to support equipment will depend on the equipment needs at that particular location, as well as site specific conditions. Grading and/or stabilization may be required within work envelopes to provide a level work surface for construction equipment and crews in upland areas. Anticipated limits of disturbance associated with grading activities are identified on the MEPA General Purpose Plans. NEP designed the Project to avoid permanent impacts to wetland resource areas to the maximum practicable extent, but since this Project consists of maintenance and improvements to an existing alignment, permanent and temporary impacts could not be avoided. Where impacts to BVW are required for work envelopes, construction mats will be temporarily placed over wetland areas to distribute equipment loads and minimize disturbance to the wetland and soil substrates. Proposed construction mat locations are shown in the MEPA General Purpose Plans. Temporary construction mats will be removed following completion of construction.

Any area identified by NEP's archaeological consultant as a potentially significant archaeological resource will be avoided if safe/practicable alternatives are available. NEP will conduct investigations for archaeological resources in accordance with a Massachusetts State Archaeologist's permitted plan prior to any site preparation or excavation.

10.3.7 Installation of Foundations and Replacement and Installation of Structures

Equipment typically used during the installation of foundations and the replacement of structures includes excavating equipment such as backhoes and excavators, rock drills/augers and concrete trucks. Suspension structures will be installed using the "Direct Embed" construction method, and Deadend structures will be installed using the "Self-Supporting" construction method, also referred to as caisson foundations, described as follows.

Table 24: Installation of Foundations and Replacement and Installation of Structures

<p>Direct Embed:</p>	<p>The installation of a direct embed structure (e.g., tangent or in-line structures) involves the excavation of a hole, the installation of a vertically placed steel culvert (corrugated pipe), placement of the new pole within the culvert, and backfill of the culvert with stone around the pole. The fill needed for these structures is the backfill required within the culvert above existing surrounding grade. Assuming the average direct embed foundation (i.e., culvert) will be installed flushed with the surrounding grade per NEP Standards, no fill above ground will result. The area affected by each foundation, assuming a 72-inch diameter culvert, is approximately 28 square feet. Guy wires and anchors will be installed as required by code.</p>
<p>Self-Supporting (Caisson Foundations):</p>	<p>The installation of a self-supporting structure (e.g., angle and dead-end structures) involves drilling a vertical subsurface temporary casing shaft (oversized to fit the permanent casing), followed by the installation of the permanent casing within the temporary casing, the installation of the steel reinforcing cage (tied rebar), the placement of anchor bolt clusters (to attach the structure to the foundation), pouring of concrete to form the foundation within the permanent casing (also called a caisson foundation), backfilling the void between the permanent and temporary casing as the temporary casing is removed, bolting the new structure to the foundation, and final grading around the base of the structure. Assuming the average caisson foundation protrudes approximately 4-ft above surrounding grade, each 10-ft diameter caisson would result in approximately 316 cubic feet of fill per pole.</p>

In general, any excavated material will be placed next to the excavation. Steel culvert casings are used to support the sides of excavations. Once the structure has been properly positioned and plumbed within the hole, the excavation will be backfilled with clean three-quarter inch minus gravel and tamped to provide structural integrity. Following the backfilling operation, any remaining excavation spoils will be spread over upland areas or removed from the site.

Handheld equipment, including shovels and vibratory tampers, are used during the backfilling of foundations and structures. Dump trucks are used to remove excavation spoils from the work site if necessary. Cranes are used to erect structures, and bucket trucks or a crane with a basket are used to lift the linemen to the aerial work zone. Tracked equipment that cannot be operated on public roadways will be transported to the work site by means of a low-bed trailer. Poles will be comprised of two (2) to three (3) sections and will be transported to the site via tractor trailers.

Dewatering may be necessary during excavations for foundations near wetland areas. At all times dewatering will be performed in compliance with the EG-303NE guidelines and BMPs. If there is adequate vegetation in upland areas to function as a filter medium, the water generally will be discharged to the vegetated land surface. Where vegetation is absent or where slope prohibits, the water will be pumped into a hay bale or silt fence settling basin located in an upland area. The pump intake will not be allowed to rest on the bottom of the excavation throughout dewatering. The basin and all accumulated sediment will be removed following dewatering operations and the area will be seeded and mulched.

10.3.8 Conductor and OPGW Installation

Following structure upgrades, the OPGW will be replaced by utilizing “Tension Stringing Methods” in accordance with Institute of Electrical and Electronics Engineers (“IEEE”) 524 and National Grid

Transmission Specifications Document # SP.06.01.301. The wire will be installed in sections varying in length from a single span to two (2) miles or more. The equipment that typically will be used during the conductor and shield wire installation operation includes stringing blocks; a multi-reel rope puller; a single reel hardline puller; a bundle tensioner; conductor reel stands; bulldozers; and cranes.

The wire stringing equipment is used to pull the conductor and shield wire through the stringing blocks one wire at a time. First the insulators and stringing blocks will be installed on the structures. Next the ropes (one per phase and shield wire) will then be pulled from structure to structure by either equipment on the ground or with a helicopter. The rope will then be used to pull in the hard line (wire rope) from the puller to the wire reels and the puller will then pull in each shield wire or phase conductor bundle. At no time during installation will the wire be permitted to come into contact with the ground. Once the wire is in place, it will be pulled up to final sag and permanently affixed to the new structures. This process will be repeated for each section of line. During the stringing operation, temporary guard structures or boom trucks with guard attachments will be placed at road and highway crossings, and at crossings of existing utility lines, to ensure public safety and the continued operation of other utility equipment. The location of the temporary guards is currently under review.

To minimize disturbance to soils and vegetation, existing access roads will be used to the fullest extent possible in the placement of wire stringing equipment and materials. The wire reels and other large material items will be transported to and along the ROW using large trucks and tractor trailers. Pickup trucks will be used to transport work crews and small materials to work sites.

10.3.9 Restoration of the ROW

Restoration efforts will be completed following the construction operations. Construction debris will be removed from the Project site and disposed of properly. Disturbed areas around structures and other graded locations will be seeded with an appropriate seed mixture and/or mulched to stabilize the soils in accordance with applicable regulations. Construction work envelopes will be loamed and seeded where necessary (i.e., where grading is proposed). Temporary sedimentation control devices will be removed following the stabilization of disturbed areas; straw bales, straw wattles, or similar may be removed or left in place after the stakes are pulled and the strings cut.

Wetland restoration areas will be monitored until 75 percent vegetative cover is achieved or in accordance with applicable agency requirements.

10.3.10 Replication Area Construction

Where wetland replication is undertaken, construction will have oversight conducted by qualified environmental consultants. Replication areas will be monitored, and corrective actions undertaken as necessary to ensure that within two (2) growing seasons there will be a 75 percent vegetative cover of indigenous wetland plant species. All work will be completed in compliance with applicable permit conditions. Wetland replications will be conducted as required under the WPA Regulations. The locations of wetland replication areas are currently under review.

10.4 CONSTRUCTION TRAFFIC AND EQUIPMENT

10.4.1 Construction Traffic

Access to the ROW for construction equipment will typically be gained from public roadways crossing the ROW in various locations along the route and adjacent existing off-ROW access roads. Because each of the construction tasks will occur at different times and locations over the course of the construction, traffic will be intermittent at these entry roadways. Traffic will consist of various vehicle types ranging from pick-up trucks to heavy construction equipment.

NEP’s contractor will coordinate closely with MassDOT to develop acceptable traffic management plans for work within state highways. NEP will coordinate with local authorities for work on local streets and roads. At locations where construction equipment will be staged in a public way, the contractor will follow a pre-approved work zone traffic control plan. Prior to use of off-ROW access roads, permission will be obtained from private landowners.

10.4.2 Construction Equipment

Table 27 lists the equipment that is likely to be required to install the new overhead transmission lines and to remove the existing structures. Any diesel-powered non-road construction equipment with engine horsepower ratings of 50 and above to be used for 30 or more days over the course of construction will either be USEPA Tier 4-compliant or will be retrofitted with USEPA-verified (or equivalent) emission control devices such as oxidation catalysts or other comparable technologies (to the extent that they are commercially available) and installed on the exhaust system side of the diesel combustion engine. NEP requires the use of ultra-low sulfur diesel fuel in its diesel-powered construction equipment and limits idling time to five (5) minutes except when engine power is necessary for the delivery of materials or to operate accessories to the vehicle such as power lifts. Vehicle idling is to be minimized during construction activities, in compliance with Massachusetts Anti-idling Law, G.L. c. 90 § 16A, c. 111 §§ 142A – 142M, and 310 CMR 7.11.

Table 25: Typical Overhead Transmission Line Construction Equipment

Construction Phase	Typical Equipment/Materials Required
Site Preparation	Pickup and other small trucks Flatbed trucks, brush hogs, bulldozers, bucket trucks for tree canopy trimming, woodchippers Erosion and sediment control devices Equipment for tree trimming and/or cutting
General Activities	Vehicles to transport personnel Side booms, forklifts and cranes to handle materials Trucks to haul sanitary/solid wastes from construction sites Pickup trucks for supplies Portable toilets / office trailers
Access Roads	Bulldozer or front-end loader Excavators / grader Dump trucks for hauling crushed stone or gravel Vibratory rollers Pickup or stake body trucks for culverts, tooling and personnel
Structure Upgrades	Trucks to haul out old hardware (roll off dumpsters) Cranes Trucks with welding equipment to cut steel supports or components Dump trucks to haul smaller components, gravel or spoils Digging equipment such as back hoes or excavators

Installation of Replacement and New Structures	<ul style="list-style-type: none"> Bulldozer or front-end loader All-terrain vehicles (ATVs) Tracked carrier (marooka) or a Skidder Flatbed trucks and tractor trailers for hauling structure components Augers Excavators and backhoes Cranes Bucket trucks Conductor pulling and tensioning rigs Helicopters Large-bore foundation drill rigs for caisson foundations Concrete trucks Pickups and other small trucks
Restoration	<ul style="list-style-type: none"> Pickup and other small trucks Excavators and backhoes Skidsteer/bull dozer Dump Trucks

10.5 SAFETY AND PUBLIC HEALTH CONSIDERATIONS

NEP will construct and maintain the facilities for the proposed Project so that the health and safety of the public are protected. This will be accomplished through adherence to all federal, state, and local regulations, and industry standards and guidelines established for protection of the public. Specifically, the proposed Project improvements will be designed, constructed, and maintained in accordance with the National Electric Standards Committee standards. The facilities will be designed in accordance with sound engineering practices using established design codes and guides published by, among others, the IEEE, the American Society of Civil Engineers (“ASCE”), the American Concrete Institute (“ACI”), and the American National Standards Institute (“ANSI”). Practices which will be used to protect the public during construction will include, but not be limited to, establishing traffic control plans for construction traffic on busy streets to maintain safe driving conditions, restricting public access to potentially hazardous work areas, and use of temporary guard structures at road and electric line crossings to prevent accidental contact with the conductor during installation.

Following construction, all transmission structures will be clearly marked with warning signs to alert the public of potential hazards if climbed or entered. Throughout the Project design and implementation sequence, NEP will evaluate locations that may require the installation of signs, and/or other types of barriers (e.g., large stones) at access points from public roads.

11.0 REGULATORY COMPLIANCE

11.1 INTRODUCTION

NEP has incorporated extensive measures into the design to avoid and minimize Project impacts to the greatest practicable extent, and where impacts cannot be avoided, NEP will implement appropriate mitigation. This section provides a general overview of the Project's approach to complying with the jurisdictional regulations of state and federal regulatory review agencies. Specific impact areas were presented previously in *Sections 3 through 8*, and mitigation measures are addressed in *Section 12: Mitigation Overview and Section 61 Findings*.

11.2 STATE REGULATIONS

11.2.1 Section 401 Water Quality Certification

The wetlands along the ROW are subject to the jurisdiction of Sections 401 and 404 of the federal Clean Water Act (CWA), 33 U.S.C. § 1251 et seq. The CWA establishes the basic federal structure for regulating discharges of pollutants into the waters of the United States and regulating quality standards for surface waters.

A Section 401 Water Quality Certification is required under the CWA for certain activities in wetlands and waters, but the law gives states the authority to review projects that must obtain federal licenses or permits and that result in a discharge to state waters. The purpose of the Massachusetts Section 401 review is to ensure that a project will comply with state water quality standards and other appropriate requirements of state law. Statutory authority for this certification is stated in the federal Clean Water Act, 33 U.S.C. § 1341, and the Massachusetts Clean Water Act, G.L. c. 21, §26-53. Regulatory authority for this certification is located at 314 CMR 9.00. Water quality standards referenced in the certification are found in 314 CMR 4.00.

This Project requires an Individual Section 401 Water Quality Certification, primarily due to the anticipated "Take" determination from NHESP under MESA. The Project also requires a Water Quality Variance due to the placement of temporary construction matting within wetlands that are located within 400-ft of the OHWM of a Class A Surface Water. Applications will be filed with MassDEP for review under 314 CMR 9.00. MassDEP evaluation criteria for applications are the incorporation of all appropriate and practicable measures for avoiding and minimizing impacts to wetland resource areas. The Project's design avoids, minimizes, and mitigates adverse impacts, as described in this section and *Section 12*.

11.2.2 Massachusetts Wetlands Protection Act

The Project will require approvals under the WPA and the implementing regulations at 310 CMR 10.00 . These regulations govern state-wetland resource areas that include BVW, RA, Bank and BLSF. Project-related impacts to these resource areas require an official finding of approval by the appropriate jurisdictional authority in the form of an OOC.

The WPA and its regulations are administered by municipal Conservation Commissions and MassDEP. Conservation Commissions are empowered under state law to issue OOCs. MassDEP has the authority to intervene in a project and to act on appeals of the OOCs. Permit applications (Notices of Intent ("NOIs")) will be filed with Conservation Commissions in Warwick, Royalston, Winchendon, Gardner, Westminster, Fitchburg, Leominster, Athol, and Sterling detailing the proposed asset improvements, the short-term and long-term impacts, and the proposed mitigation for those impacts. The wetlands review process is focused on how the Project and the proposed mitigation conform to the performance standards for each affected WPA Resource Area.

In the communities with local wetlands bylaws, the application and hearing process will also address how the Project elements and proposed mitigation measures conform to the requirements of those town bylaws. NEP will coordinate with the Conservation Commissions of these communities such that the final mitigation package appropriately addresses local requirements.

The sections below summarize the Project's compliance with the WPA's general performance standards. The mitigation described herein and in the following subsection, Federal Regulations, will be used as the basis for compliance with state and federal wetland law.

11.2.2.1 Consistency of the Project with WPA - Limited Project (310 CMR 10.53(3)(d))

As outlined in 310 CMR 10.53(3)(d), the construction, reconstruction, operation and maintenance of underground and overhead public utilities is considered a "limited project" that may, under certain circumstances, be permitted without meeting the performance standards. These include the ability of the Project to avoid impacts, minimize unavoidable impacts, and mitigate for those impacts. It is within the issuing authority's discretion to consider the magnitude of the alteration and the significance of the project site to the interests identified in the WPA; the availability of reasonable alternatives to the proposed activities; the extent to which the adverse impacts are minimized; and the extent to which mitigation measures, including replication or restoration are provided to contribute to the protection of the interests identified in the WPA. In addition, no limited project may be permitted if there will be an adverse impact to specified habitat sites of rare vertebrate or invertebrate species.

The proposed work associated with this Project occurs within an existing approved ROW. In accordance with the limited project provisions of the WPA, the Project may be permitted in accordance with the following conditions as well as any additional conditions deemed necessary by the issuing authority:

- the issuing authority may require a reasonable alternative route with fewer adverse effects for a local distribution or connecting line not reviewed by the Energy Facilities Siting Board;
- best available measures shall be used to minimize adverse effects during construction; and
- the surface vegetation and contours of the area shall be substantially restored.

An alternatives analysis has been conducted by the Proponent, as described in Section 2 of this Project Narrative. NEP is confident that the proposed Project offers the most reasonable and balanced alternative to addressing the system's needs. In terms of minimizing adverse effects during construction, *Sections 4 and 10* discusses the construction practices utilized to minimize impacts to wetland resource areas as well as to ensure that areas temporarily impacted by construction are substantially restored. In addition, NEP is committed to working with federal, state, and local regulatory agencies and providing an appropriate range of mitigation measures, including, as appropriate, replication of permanent fill impacts; wetland restoration; wetland habitat enhancement and/or permanent land preservation (see *Section 12*).

11.2.2.2 Inland Bank (310 CMR 10.54)

Bank is defined by 310 CMR 10.54(2)(a) as "the portion of the land surface, which normally abuts and confines a water body." Where Inland Bank is encountered within the Project area, the following applicable WPA general performance standards apply:

Where the presumption set forth in 310 CMR 10.54(3) is not overcome, any proposed work on a Bank shall not impair the following:

- the physical stability of the bank;
- the water carrying capacity of the existing channel within the Bank;
- ground water and surface water quality;

- the capacity of the Bank to provide breeding habitat, escape cover and food for fisheries; and
- the capacity of the Bank to provide important wildlife habitat functions.

Temporary alteration of a small amount of Inland Bank may result from the placement of construction mats across stream banks in construction work areas and along access points. Using construction mats for this purpose is intended to minimize stream bank impacts by avoiding compaction, bank erosion, and loss of vegetation which would result in permanent impact to the physical stability of the banks or the water carrying capacity of the existing channels. These areas are anticipated to be restored when construction is completed. Permanent impacts will occur to a small segment of Bank where tree removal will result in a conversion of PFO to PSS.

The proposed Project is not anticipated to impact groundwater or surface water or the capacity of the Banks to provide breeding habitat, escape cover, food for fisheries, or reduce the capacity of the Banks to provide important wildlife habitat functions following completion of the Project.

11.2.2.3 Bordering Vegetated Wetland (310 CMR 10.55)

BVW, as defined by 310 CMR 10.55(2) (a) and (c), are “freshwater wetlands that border on creeks, rivers, streams, ponds, and lakes.” BVW is prevalent throughout the Project area. Where BVW occurs, the following WPA general performance standards apply:

- Where the presumption set forth in 310 CMR 10.55(3) is not overcome, any proposed work in a BVW shall not destroy or otherwise impair any portion of said area.
- Notwithstanding the provisions of 310 CMR 10.55(4) (a), the issuing authority may issue an OOC permitting work which results in the loss of up to 5,000 sf of BVW when said area is replaced in accordance with the following general conditions and any additional, specific conditions the issuing authority deems necessary to ensure that the replacement area will function in a manner similar to the area that will be lost:
 - o the surface of the replacement area to be created (“the replacement area”) shall be equal to that of the area that will be lost (“the lost area”);
 - o the ground water and surface elevation of the replacement area shall be approximately equal to that of the lost area;
 - o the overall horizontal configuration and location of the replacement area with respect to the bank shall be similar to that of the lost area;
 - o the replacement area shall have an unrestricted hydraulic connection to the same water body or waterway associated with the lost area;
 - o the replacement area shall be located within the same general area of the water body or reach of the waterway as the lost area;
 - o at least 75% of the surface of the replacement area shall be reestablished with indigenous wetland plant species within two (2) growing seasons, and prior to said vegetative reestablishment any exposed soil in the replacement area shall be temporarily stabilized to prevent erosion in accordance with standard U.S. Soil Conservation Service methods; and
 - o the replacement area shall be provided in a manner which is consistent with all other General Performance Standards for each resource area in Part III of 310 CMR 10.00.

The Project was designed to avoid or minimize adverse impacts to the extent practicable. However, since these are existing facilities in an existing alignment, temporary and permanent alternation to BVW will occur, including a small amount of permanent fill. Unavoidable temporary impacts to BVW will occur in work areas and along access routes during construction. These impacts are primarily associated with the use of stabilization techniques (e.g., construction mats, stabilizing material) which minimize impacts while

allowing necessary work within resource areas to occur. Disturbed areas will be restored to their original condition.

11.2.2.4 Land Under Water Bodies and Waterways (310 CMR 10.56)

LUW is defined by 310 CMR 10.56(2)(a), as “the land beneath any creek, river, stream, pond or lake.” The Project crosses jurisdictional LUW at numerous locations during its length. LUW is associated with several perennial and intermittent streams and water bodies within the Project area. Where LUW is encountered, the following applicable WPA general performance standards apply:

- Where the presumption set forth in 310 CMR 10.56(3) is not overcome, any proposed work within LUW shall not impair the following
 - o The water carrying capacity within the defined channel, which is provided by said land in conjunction with the banks;
 - o Ground and surface water quality;
 - o The capacity of said land to provide breeding habitat, escape cover and food for fisheries; and
 - o The capacity of said land to provide important wildlife habitat functions.

Two (2) concrete caisson foundations are proposed within LUW in the Crystal Lake Tap in Gardner. The majority of streams and open water can be spanned or avoided by conducting work from either side of the waterbody. In several locations, temporary impacts to LUW due to the placement of construction mats was unavoidable. It is anticipated that approximately 32,206 sf of temporary impacts to LUW will occur due to the use of construction matting for access and/or work areas.

11.2.2.5 Land Subject to Flooding (310 CMR 10.57)

BLSF as defined by 310 CMR 10.57(2)(a), is “an area with low, flat topography adjacent to, and inundated by, flood waters rising from creeks, rivers, streams, ponds or lakes”. ILSF as defined by 310 CMR 10.57(2)(b), is “an isolated depression or closed basin without an inlet or an outlet. It is an area which at least once a year confines standing water to a volume of at least ¼ acre-feet and to an average depth of at least six inches”. BLSF and ILSF are present throughout the Project area. Where BLSF is encountered, the following WPA general performance standards apply:

- Compensatory storage shall be provided for all flood storage volume that will be lost as the result of a proposed project within BLSF, when in the judgment of the issuing authority said loss will cause an increase or will contribute incrementally to an increase in the horizontal extent and level of flood waters during peak flows.
- Work within BLSF, including that work required to provide the above-specified compensatory storage, shall not restrict flows so as to cause an increase in flood stage or velocity.
- Work in those portions of BLSF found to be significant to the protection of wildlife habitat shall not impair its capacity to provide important wildlife habitat functions. Except for work which would adversely affect vernal pool habitat, a project or projects on a single lot, for which a Notice(s) of Intent is filed or after November 1, 1987, that (cumulatively) alter(s) up to 10% or 5,000 sf (whichever is less) or land in this resource area found to be significant to the protection of wildlife habitat, shall not be deemed to impair its capacity to provide important wildlife habitat function. Additional alternations beyond the above threshold, or altering vernal pool habitat, may be permitted if they will have no adverse effects on wildlife habitat, as determined by procedures contained in 310 CMR 10.60.

New and/or re-established access roads within BLSF will be over-excavated and stabilized with stone rather than placing stone on top of the existing substrate so they are the same grade and there will be no loss of

flood storage capacity. Placement of foundation caissons will result in a loss of a small amount of flood storage capacity. Where necessary, lost flood storage volume will be replaced in locations not previously used for flood storage and will be incrementally equal to the theoretical volume of flood water at each elevation, up to and including the 100-year flood elevation. Compensatory flood storage areas will be located within the same reach as the lost storage volume and will have an unrestricted hydraulic connection to the waterway, to the extent possible. Compensatory flood storage will be designed to allow for the re-establishment of wet meadow and scrub shrub wetland or transitional wetland/upland environments that will contribute to wildlife habitat values.

11.2.2.6 Riverfront Area (310 CMR 10.58)

As noted in *Section 4: Wetlands and Wildlife*, 68 perennial streams are located within the Project area. Each of these perennial streams has a jurisdictional 200-ft RA. Pursuant to 310 CMR 10.58(4), where this 200-ft RA occurs within the Project area, the following WPA general performance standards apply:

***Protection of Other Resource Areas.** The work shall meet the performance standards for all other resource areas within the riverfront area as identified in 310 CMR 10.30 (coastal bank), 10.32 (salt marsh), 10.55 (BVW), and 10.57 (Land Subject to Flooding). When work in riverfront area is also within the buffer zone to another resource area, the performance standards for the riverfront area shall contribute to the protection of the interests of G.L. c. 131, s. 40 in lieu of any additional requirements that might otherwise be imposed on work in the buffer zone within riverfront area (310 CMR 10.58(4)(a)).*

***Protection of Rare Species.** No project may be permitted within the riverfront area which will have any adverse effect on specified habitat sites of rare wetland or upland, vertebrate or invertebrate species, as identified by the procedures established under 310 CMR 10.59 or 10.37, or which will have any adverse effect on vernal pool habitat certified prior to the filing of the Notice of Intent (310 CMR 10.58(4)(b)).*

***Practicable and Substantially Equivalent Economic Alternatives.** There must be no practicable and substantially equivalent economic alternative to the proposed project with less adverse effects on the interests identified in G.L. c. 131, s. 40. 310 CMR 10.58(4)(c).*

The existing ROW within the RA is currently maintained as a working ROW and has been cleared and is maintained in accordance with an approved VMP and local, state, and federal law and regulation. Maintenance of existing structures occurs on a routine basis as necessary, also in compliance with local, state, and federal law and regulation.

The Project will result in temporary disturbance and permanent impacts to portions of the RA along the Project route. Temporary disturbance in RA will result from the placement of construction mats to establish stable work and access areas. Permanent impacts will result from structure installations, access road construction and conversion of forested habitat to scrub-shrub and emergent habitat. A portion of the construction work envelopes will be loamed and seeded to allow vegetative cover to become reestablished. NEP recognizes that maintaining/reestablishing the natural vegetation within the RA is critical to protecting water supplies, providing flood control, preventing pollution and protecting wildlife and fisheries habitat. NEP will coordinate with the Conservation Commissions of the communities such that the final mitigation package appropriately addresses state and local requirements.

The Project has considered the RA performance standards in the following ways.

Protection of Other Resource Areas Within RA: To the extent practicable, the Project meets the performance standards for Bank (no impact), BLSF (no net loss of flood storage capacity), and BVW (restoration and mitigation proposed for temporary and permanent impact).

Protection of Rare Species: Project activities within the RA will occur within habitat for a protected species (one (1) amphibian, two (2) reptiles, two (2) birds and two (2) invertebrates). The consultation process has been initiated with NHESP, as described in *Section 5*. Although impacts will be avoided and minimized to the maximum extent practicable, without compromising the safety of Project construction and future maintenance personnel, there is some potential for a “take” to occur due to road improvements. A MESA Checklist will be required and a CMP may also be necessary. The final determination will be based on the feedback and direction received from NHESP. If a CMP is required, several potential mitigation options are available, as described in *Section 5*. Coordination with NHESP will ensure that the proper approach is used, and a protection plan for all Project related state-listed species is provided if needed.

Practicable and Substantially Equivalent Economic Alternatives: The WPA general performance standards for RA require that the applicant prove by a preponderance of the evidence that there are no practicable and substantially equivalent economic alternatives to the proposed Project with less adverse effects on the interests identified in the WPA. *Section 2* discusses the alternatives evaluated to minimize impacts to wetland resource areas. This information will be provided as part of the NOIs prepared for the Project.

No Significant Adverse Impact: Impacts are fully described in *Section 4* and proposed mitigation measures are addressed in *Section 12*. Temporary impacts where necessary for installation of linear site-related utilities are allowed within the RA, provided the area is restored to its natural conditions (310 CMR 10.58 (4) (d) 1.a.). Although RA impacts resulting from the proposed Project are primarily temporary land disturbance, all disturbance will be temporary in nature. Proposed tree removal will result in conversion of forested habitat to scrub-shrub and emergent habitat. The majority will be restored to existing ROW conditions, most of which has been historically affected by the safe operation of the transmission facilities. Unavoidable permanent impacts include the improvement of existing access routes (expansion and grading) to ensure safe access to existing and proposed structures, and direct installation of replacement structures.

To offset temporary construction impacts, protective measures and BMPs will be in place to avoid and minimize impacts. The approach for accessing the site, establishing work areas and performing construction activities is discussed in detail in *Section 10: General Transmission Line Construction Procedures*. The proposed Project will not result in a significant adverse impact or impairment or reduce the capacity of the RA to provide important wildlife habitat functions.

11.2.2.7 Isolated Vegetated Wetlands (IVW) and Isolated Land Subject to Flooding (310 CMR 10.57)

ILSF is defined at 310 CMR 10.57(2)(b) as an isolated depression or a closed basin that serves as a ponding area for run-off or high ground water which has risen above the ground surface. Isolated wetlands are not jurisdictional resource areas under the WPA unless they hold enough water to meet the definition of ILSF (310 CMR 10.57(2)(b)). During field investigations, wetlands were not delineated beyond the utility ROW. Off-ROW hydrologic connections were assumed for wetlands located on the border of the ROW.

11.2.2.8 Wildlife Habitat Evaluations (310 CMR 10.60)

A wildlife habitat evaluation was completed pursuant to 310 CMR 10.60 and the procedures and methods detailed in MassDEP’s Massachusetts Wildlife Habitat Protection Guidance for Inland Wetlands.

Requirements for completing wildlife habitat evaluations depend on the type of wetland resource area impacted and the magnitude of impact. As part of the MassDEP Guidance document, two forms are typically used for Wildlife Habitat Evaluations – Appendix A and Appendix B. Appendix A is a “simplified” evaluation generally used for projects with limited resource area impacts. Appendix B is a more detailed evaluation generally used for evaluating projects with larger impacts, project locations within VP habitat, mapped “Habitat of Potential or Statewide Importance” and/or other activities specified on the Appendix A form.

Appendix B evaluations were conducted for the Project because of the nature of the Project and the cumulative impacts to jurisdictional resource areas. The wildlife habitat evaluation is summarized in *Section 4: Wetlands and Wildlife*, and applicable portions are presented in *Appendix F*. Some habitat functions associated with forested wetland will be permanently altered as a result of the proposed Project, but they will be replaced by the increasingly scarce scrub-shrub habitat. Consequently, the proposed Project will not result in a significant adverse impact or impairment or reduce the capacity of the RA to provide important wildlife habitat functions.

11.2.3 Massachusetts Stormwater Standards

MassDEP applies the Massachusetts Stormwater Management Standards pursuant to the wetlands regulations (310 CMR 10.00) and the water quality regulations (314 CMR 9.00) relating to stormwater. The Stormwater Standards define 10 performance management standards for development and redevelopment projects. Minimal impervious surfaces are proposed for the Project. Portions of the Project subject to the Stormwater Management Standards are limited to new caisson foundations.

Although the proposed work is considered to be eligible for limited project status, NEP will meet the stormwater standards to the maximum extent practicable. NEP will coordinate with engineers, regulators and local conservation commissions to develop stormwater management plans for these areas, as appropriate.

11.2.4 Surface Water Discharge Permit

Due to earth disturbing activities of more than one (1) acre, this Project will require a federal NPDES Construction General Permit (“CGP”) and associated coverage pursuant to the Surface Water Discharge regulations (314 CMR 3.00) specifically 314 CMR 3.06. The NPDES CGP requires filing an NOI that provides information on the site and identifies the site’s general operator, and development of a SWPPP that includes appropriate BMPs to minimize pollutant discharges.

The Project will comply with the requirements of the NPDES CGP. As a component to this compliance, a site-specific SWPPP will be prepared and implemented throughout the Project’s construction and restoration phases. Implementation of this plan will include extensive use of erosion and sediment control measures designed to minimize site disturbance and prevent opportunities for sedimentation to occur offsite or toward wetland resource areas. The SWPPP will be included in each NOI, along with Bureau of Water Resources Surface Water Discharge (NPDES) Permitting Program WM 15 permit application and it is anticipated that the requirements of the SWPPP will be included in the OOC issued by each community within the Project area.

11.2.5 Waterways Permitting

The Project crosses several rivers and streams that are subject to waterways licensing jurisdiction by MassDEP under Massachusetts General Law c. 91 and the implementation regulations, 310 CMR 9.00. However, as described below, all of the jurisdictional Project-related crossings are exempt from licensing.

11.2.5.1 Jurisdictional Crossings

Chapter 91 geographic jurisdiction includes non-tidal rivers or streams “on which public funds have been expended for stream clearance, channel improvement, or any form of flood control or prevention work... except for any portion of any such river or stream which is not normally navigable during any season, by any vessel including canoe, kayak, raft, or rowboat...” 310 CMR 9.04(1)(e). All “structures” in these rivers and streams are subject to waterways licensing under 310 CMR 9.05(i). A “structure” is defined as “any man-made object which is intended to remain in place . . . over . . . waterways.” 310 CMR 9.02. Thus, MassDEP requires a c. 91 license for electric transmission crossings over rivers and streams even where there is no physical structure in the stream or river.

Perennial Streams: Based on field reviews, 68 perennial streams were identified within or immediately adjacent to the Project ROW. All perennial stream crossings that intersect with the A1/B2 ACR were assumed, for purposes of determining c. 91 jurisdiction, to be “normally navigable” by canoe, kayak, raft or rowboat.

Intermittent Streams: 60 intermittent streams were identified within or immediately adjacent to the Project ROW. All other streams delineated within or immediately adjacent to the ROW are either not shown on the most recent USGS topographic maps as intermittent, or are depicted as intermittent waterways. According to the field reviews conducted in 2020, bank heights and width are variable.

To determine whether intermittent streams were “normally navigable” under §9.04(1)(e), bank height, width and water depth were all considered. In particular, intermittent streams were determined to be navigable if all of the following criteria were met:

- Discernable channel/bank
- Bank width of three feet or greater
- Water depth of twelve inches or greater

Based on field reviews to date, many of the intermittent streams within the Project ROW meet these criteria. Of the 128 streams reviewed, there are 66 occurrences of tree removal intersecting intermittent streams and 100 occurrences of tree removal intersecting perennial streams. There are 47 occurrences where work envelopes/pull pad envelopes intersect intermittent streams and 26 occurrences where these activities intersect with perennial streams.

11.2.5.2 Exempt Crossings

All of the jurisdictional crossings listed above are expressly exempt from c. 91 if they are covered by a final wetland OOC and meet the following related tests: they are constructed and maintained in accordance with the NESC and do not reduce the space available for navigation (310 CMR 9.05(3)(g)).

All of the Project crossings are exempt from c. 91 licensing because they will require an OOC from the applicable local Conservation Commission. Moreover, the Project crossings will be “overhead wires ... constructed and maintained in accordance with the National Electrical Safety Code,” as all electrical transmission lines are required to be constructed and maintained in accordance with all applicable legal standards, including the NESC and 220 CMR 125.00 Installation and Maintenance of Electric Transmission Lines. Finally, due to the significant increase in the height of the replacement structures, there will be an increase in the crossing height above the waterway surface and thus will not “reduce the space available for navigation.”

In sum, the required OOCs for this Project will fulfill the requirements of 310 CMR 9.05(3)(g) to exempt all of the crossings of navigable water streams from c. 91 licensing requirements.³⁴

11.2.6 Massachusetts Department of Transportation

MassDOT is responsible for the Permit to Access State Highway/Non-Municipal Utility Permits for crossing over of state roads with utility lines and for Permanent Access Permit with the Highway Layout.³⁵ The proposed Project's impacts relative to MassDOT are associated with the installation of new overhead wires across state roadways by a non-municipal utility, a proposed permanent access from a MassDOT roadway, and permanent structure installations within the highway layout. The installation could temporarily affect traffic flow of the roadway but does not involve physical modifications to the roadway or roadway ROW. NEP will comply with all required measures to ensure a safe environment for traffic flow and construction crews in and around the roadways.

BSC on behalf of NEP conducted a consultation with MassDOT on 08/25/22 to discuss change in alignment due to removal of existing structure 537-1, two proposed structures located within state highway layout along Depot Road, and the proposed access road to Great Wolf Lodge.

As a result of the consultation, it has been identified:

- A clearing permit can be submitted for any required clearing on MassDOT property for the realignment.
- Continued consultation required for the proposed structures within the state highway layout, MassDOT Engineer to follow up with MassDOT Operations regarding the access rights to the area.
- New access from Great Wolf Lodge requires roadway plans including proposed tree removals to be reviewed when permanent access permit is submitted. MassDOT also requires a chain fence gate at the property line to prevent unauthorized vehicle access.

11.2.5 Massachusetts Endangered Species Act

NEP will coordinate closely with NHESP pursuant to MESA (G.L. c. 131A) and WPA (G.L. c. 131, §40) to avoid impacts to listed species and their habitat, and to provide mitigation for any unavoidable impacts. Although impacts will be avoided and minimized to the maximum practicable extent without compromising the safety of Project construction and future maintenance personnel, there is some potential "take". A CMP will be provided, if required.

³⁴ NEP has researched whether each of the waterway crossings along the Project Route is likely to require an Order of Conditions, eliminating the need for a c. 91 license. For each crossing where NEP has determined that an OOC is required, there is some possibility that the local conservation commission could require construction plan revisions that would change the wetlands and waterways analysis. One possible scenario is this change could eliminate the need for an OOC, in which case NEP would submit a c. 91 license application. NEP has determined that each of the poles near the crossings must be in the proposed location for constructability purposes, making a scenario where the conservation commission insists on relocating poles outside of wetlands areas unlikely. If pole locations must be changed in a way that relieves the OOC requirement, however, NEP will determine at that time whether a c. 91 license application is necessary for the relevant crossing.

³⁵ NEP is evaluating the location of replacements structures along Depot Road in Westminster. The original easement CRT 87 (*Charles H. Dupee et ux*), granted rights to NEP that allow the structure relocation. In addition, the highway taking/relocation in 1985 reserved the rights of all electric transmission easements. The structure relocation is being proposed as an "in-kind" replacement. Should MassDOT deem it to be otherwise, a permanent access permit may be required. NEP will consult with MassDOT.

The NHESP analysis will not be complete until NEP files for MESA Review. As such, coordination will continue until the submittal of the MESA Project Review Checklist. NEP will work closely with NHESP to develop a mutually agreed upon protection plan for the state-listed species, if needed.

11.2.6 Massachusetts Historical Commission

Any projects that require funding, licenses, or permits from any state agency must be reviewed by MHC in compliance with G.L. c. 9, §26-27C. This law created the MHC, the office of the State Archaeologist, and the State Register of Historic Places, among other historic preservation programs. It provides for MHC review of state projects, State Archaeologist's Permits, the protection of archaeological sites on public land from unauthorized digging, and the protection of unmarked burials. The regulations that guide MHC review of state funded, licensed or permitted projects are published in Chapter 9, Section 26-27C (950 CMR 70-71). If the Project is found to have an adverse effect to a significant historic property or archaeological site, NEP will consult with MHC and other parties, as appropriate, to determine the feasible measures to avoid, minimize or mitigate the adverse effect.

11.2.7 Energy Facilities Siting Board

A Petition for Approval to Construct and Operate the Project will be filed with the EFSB (or "Siting Board") pursuant to Chapter 164, Section 69J of the General Laws. Under Chapter 164, Section 69G, a "facility" requiring approval by the EFSB includes:

- A new electric transmission line having a design rating of 115 kV or more which is 10miles long or more on an existing transmission corridor except reconductoring or rebuilding of transmission lines at the same voltage.
- An ancillary structure which is an integrated part of the operation of any transmission line.

This Project meets both requirements. The EFSB approval process includes filing the Petition followed by an extensive and lengthy adjudicatory process. The Siting Board has a statutory requirement to implement its policies in order "to provide a reliable energy supply for the Commonwealth with a minimum impact upon the environment at the lowest possible cost." (G.L. c. 164, §69H and 69J). Further, G.L. c. 164, §69J requires the Siting Board to review alternatives to planned projects, including "other site locations." A petitioner to the Siting Board must demonstrate that it has examined a reasonable range of practical siting alternatives, and that its "proposed facilities are sited at locations that minimize costs and environmental impacts while ensuring supply reliability".

A Petition for Approval to Construct is expected to be submitted to the EFSB in late 2022, which will initiate their review process. Concurrently with its Petition to the Siting Board, NEP intends to file Petitions with the DPU: (1) requesting a determination that the Project is necessary and will serve the public convenience and be consistent with the public interest in accordance with G.L. c. 164, § 72 ("Section 72"); and (2) requesting exemptions from the Zoning Ordinances of the Project communities pursuant to G.L. c. 40A, § 3.

Some sections of this Expanded ENF are similar to what will be submitted to the Siting Board (e.g., Project Information, Alternatives Assessment and the Project route impacts). As required by the EFSB, the Petition will also document the load forecast methodology and the complex contingency analysis using computer modeling. These pieces of information will comprehensively establish the need for the Project as stipulated by applicable EFSB requirements.

NEP is confident that the Project represents the optimal solution because it meets the reliability needs; comparatively offers the best solution with the least amount of adverse impacts, and provides a cost-effective solution.

11.3 FEDERAL REGULATIONS

11.3.1 Section 404 of the Clean Water Act

As noted in the discussion of state permits, the wetlands along the ROW are subject to the jurisdiction of Sections 401 and 404 of the federal CWA. The CWA establishes the basic structure for regulating discharges of pollutants into the waters of the United States and regulating quality standards for surface waters. The Section 401 Water Quality Certification, as administered by MassDEP, was discussed previously. The Section 404 process is administered by the USACE.

The USACE (Federal Register 1982) and the EPA (Federal Register 1980) jointly define wetlands as “areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas.” Section 404 of the CWA establishes permit programs to regulate the discharge of dredged or fill material into waters of the United States, as well as discharges of dredged or fill material into wetlands adjacent to nominal waters (33 CFR 328). The Project qualifies for Pre-Construction Notification (“PCN”) in accordance with the USACE Massachusetts General Permits for activities within federal wetlands as defined by Section 404 of the CWA, primarily due to the temporary BVW impacts associated with construction mats, which are considered “fill”. NEP anticipates submitting a PCN and continuing to consult with USACE through the permitting process.

The Project will meet the USACE’s requirement that areas of permanent fill be mitigated. Mitigation will be determined using criteria defined in the 2016 New England District Compensatory Mitigation Guidance, and through consultation with the USACE New England District.

Permanent impacts to VPs have been avoided and no temporary work envelopes will be placed within VPs pools during spring and/or fall breeding seasons. Use of construction BMPs will be employed to avoid and minimize indirect impacts to the VPs in the vicinity of the Project. Construction-related details will be provided in permit applications and are also addressed in *Section 10: General Transmission Line Construction Procedures*.

11.3.2 Environmental Protection Agency

The NPDES program in Massachusetts requires that any construction project disturbing one (1) or more acres of land and will discharge stormwater (or dewatering discharges) from a site into municipal separate stormwater system or into water of the U.S., must first seek coverage under, and comply with, the EPA’s Stormwater General Permit. The NPDES CGP requires filing an NOI that provides information on the site and identifies the site’s general operator; development of a SWPPP that includes appropriate BMPs to minimize pollutant discharges; and submitting a Notice of Termination (“NOT”) when the site has achieved final stabilization or stormwater is no longer being discharged.

The Project will comply with the requirements of the NPDES CGP. As a component to this compliance, a site-specific SWPPP will be prepared and implemented throughout the Project’s construction and restoration phases. Implementation of this plan will include extensive use of erosion and sediment control measures designed to minimize site disturbance and prevent opportunities for sedimentation to occur offsite or toward wetland resource areas. The SWPPP will be included in each NOI, and it is anticipated that the requirements of the SWPPP will be included in the OOC issued by each community within the Project area.

11.3.3 U.S. Fish and Wildlife Service

Under the Endangered Species Act (“ESA”), any action requiring one (1) or more federal permits or licenses must also consult with the US Fish and Wildlife Service (“USFWS”) to ensure that proposed actions do not

jeopardize listed species or destroy or adversely modify critical habitat. Accordingly, the USFWS Endangered Species Consultation Procedure available on their website was followed. As a result, it was determined while the Project area is mapped for the Federally Listed northern long-eared bats (*Myotis septentrionalis*), but that there are no known hibernacula within 0.25 miles of the Project area and no known maternity roost trees within a 150-ft buffer. Therefore, currently, no additional consultation is required. However, note that a status review of the northern long-eared bat has been completed, and the final recommendations regarding its status will be published, reviewed, and accepted in 2022. Additional consultation may be required, pending the outcome of this process.

The Endangered Species Consultation determined that one (1) candidate insect, Monarch Butterfly (*Danaus plexippus*), one (1) endangered plant, and one (1) threatened plant may be present within the Project area along with the northern long-eared bat. In 2020, the USFWS concluded that listing the monarch under the ESA is warranted; but, precluded by higher priority listing actions. Based on the USFWS' priorities and workload, the USFWS intends to propose listing the monarch in Fiscal Year 2024, if listing is still warranted at that time. In the meantime, the Monarch is designated as a candidate under the ESA. Candidate species are not protected under the ESA, but the USFWS reviews their status annually, and could decide to initiate the listing process sooner than 2024.

Review is ongoing to determine permitting and/or avoidance measures for the two (2) plants identified.

11.3.4 Section 106 of the National Historic Preservation Act

Section 106 of the National Historic Preservation Act of 1966 ("NHPA" or "Section 106") requires Federal agencies to take into account the effects of their undertakings on historic properties and afford the Advisory Council on Historic Preservation ("ACHP") a reasonable opportunity to comment (33 CFR 325 Appendix C and 36 CFR Part 800 and 33 CFR 325, Appendix C). Pursuant to 36 CFR 800.16, an undertaking consists of "a project, activity, or program funded in whole or in part under the direct or indirect jurisdiction of a federal agency, those carried out with federal financial assistance, those requiring a federal permit, license or approval and those subject to State or local regulation administered pursuant to a delegation or approval by a federal agency."

For the Project, the undertaking is the Section 404 Permit, and the responsible federal agency is the USACE. "Section 106 review" follows a specific process, which is guided by federal regulations (36 CFR 800 and 33 CFR 325, Appendix C). These regulations have created a series of steps by which federal agencies identify and evaluate historic properties that may be affected by their undertakings, assess adverse effects to those properties, and take prudent and feasible measures to avoid, minimize, or mitigate those effects.

12 MITIGATION OVERVIEW AND SECTION 61 FINDINGS

12.1 INTRODUCTION

Mitigation is a means of offsetting potential adverse effects of human activity on the environment. The development of mitigation measures has become an integral part of the regulatory process and of conservation planning efforts. Most state legislation requiring mitigation measures does not prescribe the specific mitigation activity that must take place, and mitigation can take many forms, including the following:

- Avoiding an impact by not taking an action or redirecting/relocating an action;
- Minimizing an impact by limiting the degree of action taken;
- Restoring, rehabilitating or repairing the affected environment;
- Preservation and maintenance activities to reduce or eliminate the impacts over time; and
- Providing replacement or substitute resources or environments.

NEP is incorporating elements of these approaches in its overall mitigation plan to comprehensively address potential impacts associated with the proposed maintenance and improvements to the A1/B2 Lines. This section presents a comprehensive overview of the mitigation measures discussed in *Sections 3 through 8*, respectively, for land use, wetlands and wildlife, rare species, historic/archeological resources, EJ communities and climate change adaptation and resiliency.

MEPA requires state agencies to make findings on environmental damage and mitigation measures before issuing a state permit for a project requiring an EIR (301 CMR 11.07 (so-called Section 61 Findings)). The MEPA regulations at 301 CMR 11.07(6)(k) require that the EIR contain the proposed Section 61 Findings. In accordance with this requirement, NEP's proposed Section 61 Findings for the Project are also presented herein.

12.2 MITIGATION OVERVIEW

As noted throughout this document, NEP has incorporated an approach that avoids and minimizes impacts wherever practicable. For example, the proposed design utilizes existing utility corridors and, whenever feasible, locates replacement structures close to existing structures; relocates replacement structures such that they span wetland resource areas; clears vegetation only where necessary for safe operation; and utilizes upland access routes for construction purposes.

NEP has also evaluated alternative construction methodologies designed to reduce impacts to environmentally sensitive areas. Specifically, NEP and their consultant team assessed the constructability of the Project to identify ways to minimize impacts from installation of access roads and construction work envelopes. Work envelopes have been designed to safely facilitate construction on energized lines ("live line" construction). Live line construction is required due to outage constraints along the Lines. Within RFA, work pads will be loamed and seeded, and in the uplands, work envelopes will remain to ensure safe and stable work areas for future maintenance and emergency responses. Access roads have been designed to limit grading where necessary and will incorporate stormwater BMPs for stability and avoidance of impacts to adjacent water resources. Consultation with NHESP is ongoing.

Mitigation measures proposed for construction include appropriate BMPs such as erosion control barriers, use of construction mats, minimizing areas of disturbance, and restoration when necessary.

In terms of mitigation during construction, NEP has established BMPs that will be followed by all NEP employees and contractors for accessing sites and performing construction activities on transmission ROWs. These procedures, outlined in *Section 10.0 and Appendix C*, ensure that the Project will be

completed in accordance with all applicable environmental laws and regulations as well as with NEP policies and compliance objectives.

Project impacts are largely associated with work within wetland resource areas and include temporary and permanent impacts that may be mitigated by implementing a variety of measures that comprise a comprehensive mitigation package. Such measures may include restoration of temporarily impacted areas and replication to compensate for permanent impacts. Mitigation will be determined using criteria defined in the 2016 New England District Compensatory Mitigation Guidance and through consultation with the USACE New England District, MassDEP, and local Conservation Commissions.

NEP is committed to developing a mitigation package that addresses potential Project impacts to the greatest practicable extent. NEP anticipates that the final mitigation package will be developed during the federal, state and local permitting processes outlined in Section 1 of this Project Narrative, and that the mitigation package will fully address the concerns and required permit conditions. Proposed mitigation measures will be reviewed by the Conservation Commission in each town, MassDEP, NHESP, MHC, and the USACE, and ultimately will be incorporated into the permits and OOCs issued for the Project.

12.3 SECTION 61 FINDINGS

The remainder of this section presents the proposed Section 61 Findings in compliance with 301 CMR 11.07(6)(k). These proposed findings have been developed considering consultations with various state agencies. While NEP will continue to consult with certain agencies concerning mitigation, this Expanded ENF contains the most up-to-date information on the Project's mitigation measures, including those to which NEP has committed to and those under discussions with agencies. Each Section 61 Finding is essentially a stand-alone document, so it does not incorporate previously defined acronyms.

Proposed Section 61 Findings for Massachusetts Department of Environmental Protection (Mass DEP)

DRAFT FINDINGS PURSUANT TO G.L. CHAPTER 30, SECTION 61

Project Name: A1/B2 Transmission Lines Asset Condition Refurbishment Project

Project Location: Warwick, Royalston, Winchendon, Gardner, Westminster, Fitchburg, Leominster, Athol, and Sterling.

Project Proponent: New England Power Company (“NEP”)

EOEA Number: To Be Determined

Agency Actions: Massachusetts Department of Environmental Protection Section 401 Water Quality Certification

Intent of These Section 61 Findings: MEPA regulations 301 CMR 11.12(5) stipulate that in “accordance with G.L. c.30, §61, any Agency that takes Agency Action on a Project for which the Secretary required an EIR shall determine whether the Project is likely, directly or indirectly, to cause any damage to the environment and make a finding describing the damage to the environment and confirming that all feasible measures have been taken to avoid or minimize the damage to the environment.” The Section 61 Findings are incorporated into the conditions or restrictions to the relevant permit or authorization. The following proposed Section 61 Findings have been prepared by the Project Proponent and are intended to assist the state permit-issuing agency in fulfilling its obligations in accordance with G.L. c. 30, §61. These Findings are limited to the subject matter jurisdiction of the Section 401 Water Quality Certification sought from the Massachusetts Department of Environmental Protection.

Project Description: The Project includes complete refurbishment of 54 miles of 69 kV Transmission Line assets including structures replacements and installations, access improvements or re-establishment and construction of new access, and vegetation cutting. New construction is proposed for this Project.

Comprehensive inspections have identified structures and wires are in need of replacement due to asset condition and aging infrastructure and lack of safe access for maintenance and emergency needs. From a safety and reliability perspective, in order to extend asset life, the following activities are proposed:

- Replacement of 711 structures
- Installation of approximately 305 concrete caisson foundations
- Installation of six (6) new vertical jumper switch structures
- Reconductoring of both circuits with 795 Aluminum-conductor steel-supported conductor (ACSS), installation of two (2) OPGW
- Construction of new and/or re-establishment of access roads
- Relocation of ~5.2 miles of centerline, approximately 41.5-ft north towards the I135S/J136S Transmission Lines within an existing ROW, in Leominster.
- ROW vegetation cutting to obtain a minimum horizontal clearance of 30-ft to the edge of ROW/easement under all horizontal clearance weather conditions. On average, the existing ROW vegetation removal is 85-ft. The ROW will be cleared to 100-ft on the mainline and Crystal Lake Tap Line and 125-ft Athol Tap Line to obtain the necessary horizontal clearance requirements.
- Some tree removal may be required to accommodate Project access.

In addition, the existing shield wire will be replaced with OPGW to provide high speed communications between substations. .

This Project requires an Individual Section 401 Water Quality Certification, primarily due to the anticipated “Take” determination from NHESP under MESA. The Project also requires a Water Quality Variance due to the placement of temporary construction matting within wetlands that are located within 400-ft of the OHWM of a Class A Surface Water. Applications will be filed with MassDEP for review under 314 CMR 9.00. MassDEP evaluation criteria for applications are the incorporation of all appropriate and practicable measures for avoiding and minimizing impacts to wetland resource areas. The Project’s design avoids, minimizes, and mitigates adverse impacts, as described in this section and *Section 11*.

MEPA History: Pursuant to G.L. c. 30, §61- §62A-H, of the Massachusetts Environmental Policy Act (“MEPA”) and its implementing regulations at 301 CMR 11.00, the Proponent (“NEP”) has prepared and submitted this Expanded (“ENF”) to the MEPA office. The Expanded ENF is the first MEPA filing associated with this Project. The Project is subject to MEPA review as it requires one or more state permits and exceeds the following thresholds requiring the filing of an:

- ENF and an EIR for Wetlands, Waterways and Tidelands because a permit is required, and there is expected to be alteration of one or more acres of bordering vegetated wetlands (301 CMR 11.03(3)(a)(1)(a)).
- EIR for Land because there is expected to alter 50 or more acres of land (301 CMR 11.03(1)(1)).
- EIR for Wetlands, Waterways and Tidelands because a permit is required, and there is expected to be an alteration of ten or more acres of other wetlands (301 CMR 11.03(3)(a)(1)(b)).
- EIR for Environmental Justice Populations as the Project is located within a Designated Geographic Area around an Environmental Justice Population (301 CMR 11.06(7)(b)).

Additionally, the proposed Project requires state permits from the 401 Water Quality Certification, Natural Heritage and Endangered Species, Department of Conservation and Recreation, Massachusetts Department of Waterways, Energy Facilities Siting Board, Department of Public Utilities, Massachusetts Department of Environmental Protection and Massachusetts Department of Transportation.

Project Impacts: Impacts relative to the Section 401 Water Quality Certificate include the permanent fill of approximately 1,896 sf of BVW due to structure foundations, approximately, 667,928 sf (~15 acres) of forested wetland conversion due to tree removals, and approximately 51 acres (2,200,651 sf) of BVW temporarily impacted by construction mats, and the anticipated take for work within rare species habitat by NHESP.

Project Mitigation: Mitigation was considered as a matter of course during the planning and design process as an overall approach to avoiding impacts whenever possible. In terms of mitigation during construction, NEP has established procedures that are to be followed by all NEP employees and its contractors for accessing sites and performing construction activities on transmission ROWs. These procedures ensure that this Project will be completed in accordance with all applicable environmental laws and regulations as well as with NEP policies and compliance objectives. NEP completed field investigations and a constructability review along the Project Route to determine access routes and construction techniques to be implemented during construction of the Project to provide an accurate impact assessment and to design work to avoid and minimize impacts within wetlands and other sensitive resources (e.g., cultural resources) to the greatest extent practicable. Accordingly, the below-listed commitments are to be carried out by NEP to ensure that all proposed wetlands and waterways mitigation strategies will be implemented as the Project proceeds.

Table 26: Wetlands & Waterways Mitigation Strategies for the Project

Wetland Resource Area	Impact	Mitigation Measures	Responsible Party/ Implementation
BVW	Temporary alterations during construction; permanent fill for structure installation	<p>Use construction mats for access through wetlands, across streams and other sensitive areas to minimize compression of soils, rutting, and disturbance of vegetation.</p> <p>Provide mitigation to be determined in consultation with agencies to offset any permanent wetland impacts.</p> <p>Habitat enhancement in wetland resource areas affected by tree removal to minimize impacts from change in wetland function.</p> <p>Implement SWPPP.</p>	<p>Contractor/Construction</p> <p>Contractor/Construction/ Potential post-construction monitoring</p> <p>Contractor/Construction</p> <p>Contractor/Construction</p>
BLSF	Temporary alteration and permanent fill of floodplain for access, work envelopes and structures	<p>Restore areas temporarily impacted, as appropriate. Provide mitigation for permanent flood storage loss due to structure installation and potential grading required for access and construction work envelope.</p> <p>Employ temporary erosion controls (e.g., silt fence, hay/straw bales, filter socks, mulching, temporary and/or permanent reseeding) and sedimentation controls, as appropriate.</p>	<p>Contractor/ NEP Construction/Potential post-construction monitoring</p> <p>Contractor/ Construction</p>
RA	Temporary impact to Riverfront Area for access and work envelopes.	<p>Restore areas temporarily impacted.</p> <p>Employ temporary erosion controls (e.g., silt fence, hay/straw bales, filter socks, mulching, temporary and/or permanent reseeding) and sedimentation controls, as appropriate.</p>	<p>Contractor/ Construction</p> <p>Contractor/ Construction</p>
Bank	Temporary impact to bank due to access and work envelopes. In most cases, construction mat crossing will span the Bank of rivers and stream; however, the potential for alteration has been	<p>Use construction mats to minimize compression of soils, rutting, and disturbance of vegetation.</p>	<p>Contractor/ Construction</p>

	accounted for in the Project impact calculations.		
LUW	Temporary impact to LUW for access, work envelopes and pull pads. Permanent impact for two (2) concrete caissons.	Use construction mats to minimize compression of soils, rutting, and disturbance of vegetation.	Contractor/ Construction
Waterways	Potential impacts to non-tidal waterways from overhead wires.	Overhead crossings designed to avoid conflicts and allow for unimpeded access by foreseeable watercraft.	NEP/ Planning

Proposed Section 61 Findings Massachusetts Department of Transportation (MassDOT)

DRAFT FINDINGS PURSUANT TO G.L. CHAPTER 30, SECTION 61

Project Name: A1/B2 Transmission Lines Asset Condition Refurbishment Project

Project Location: Warwick, Royalston, Winchendon, Gardner, Westminster, Fitchburg, Leominster, Athol, and Sterling.

Project Proponent: New England Power Company (“NEP”)

EOEA Number: To Be Determined

Agency Action: Massachusetts Department of Transportation Permit to Access State Highway and Permanent Access Permit within the Highway Layout

Intent of These Section 61 Findings: MEPA regulations 301 CMR 11.12(5) stipulate that in “accordance with G.L. c. 30, §61, any Agency that takes Agency Action on a Project for which the Secretary required an EIR shall determine whether the Project is likely, directly or indirectly, to cause any damage the environment and make a finding describing the damage to the environment and confirming that all feasible measures have been taken to avoid or minimize the damage to the environment.” The Section 61 Findings are incorporated into the conditions or restrictions to the relevant permit or authorization. The following proposed Section 61 Findings have been prepared by the Project Proponent and are intended to assist the state permit-issuing agency in fulfilling its obligations in accordance with G.L. c. 30, §61. These Findings are limited to the subject matter jurisdiction of the State Highway Access Permit sought from the Massachusetts Department of Transportation (“MassDOT”).

Project Description: The Project includes complete refurbishment of 54 miles of 69 kV Transmission Line assets including structures replacements and installations, access improvements or re-establishment and construction of new access, and vegetation cutting. New construction is proposed for this Project.

Comprehensive inspections have identified structures and wires are in need of replacement due to asset condition and aging infrastructure, and lack of safe access for maintenance and emergency needs. From a safety and reliability perspective, in order to extend asset life, the following activities are proposed:

- Replacement of 711 structures
- Installation of approximately 305 concrete caisson foundations
- Installation of six (6) new vertical jumper switch structures
- Reconductoring of both circuits with 795 Aluminum-conductor steel-supported conductor (“ACSS”), installation of two (2) OPGW
- Construction of new and/or re-establishment of access roads
- Relocation of ~5.2 miles of centerline, approximately 41.5-ft north towards the I135S/J136S Transmission Lines within an existing ROW, in Leominster.
- ROW vegetation cutting to obtain a minimum horizontal clearance of 30-ft to the edge of ROW/easement under all horizontal clearance weather conditions. On average, the existing ROW vegetation cutting is 85-ft. The ROW will be cleared to 100-ft on the mainline and Crystal Lake Tap Line and 125-ft Athol Tap Line to obtain the necessary horizontal clearance requirements.
- Tree removals to accommodate construction access.

In addition, the existing shield wire will be replaced with OPGW to provide high speed communications between substations.

The Project includes installation of structures and access routes within the highway layout, as well as temporary access to pull conductor across the highway subject to 700 CMR 13.00.

MEPA History: Pursuant to G.L. c. 30 §61- §62A-H, of the Massachusetts Environmental Policy Act (“MEPA”) and its implementing regulations at 301 CMR 11.00, the Proponent (“NEP”) has prepared and submitted this Expanded ENF to the MEPA office. The Expanded ENF is the first MEPA filing associated with this Project. The Project is subject to MEPA review as it requires one or more state permits and exceeds the following thresholds requiring the filing of an:

- ENF and an EIR for Wetlands, Waterways and Tidelands because a permit is required, and there is expected to be alteration of one or more acres of bordering vegetated wetlands (301 CMR 11.03(3)(a)(1)(a)).
- EIR for Land because there is expected to alter 50 or more acres of land (301 CMR 11.03(1)(1)).
- EIR for Wetlands, Waterways and Tidelands because a permit is required, and there is expected to be an alteration of ten or more acres of other wetlands (301 CMR 11.03(3)(a)(1)(b)).
- EIR for Environmental Justice Populations as the Project is located within a Designated Geographic Area around an Environmental Justice Population (301 CMR 11.06(7)(b)).

Additionally, the proposed Project requires state permits from the 401 Water Quality Certification, Natural Heritage and Endangered Species, Department of Conservation and Recreation, Massachusetts Department of Waterways, Energy Facilities Siting Board, Department of Public Utilities, Massachusetts Department of Environmental Protection and Massachusetts Department of Transportation.

Project Impacts: The proposed Project’s impacts relative to MassDOT are associated with the installation of new overhead wires across state highways by a non-municipal utility. Guard structures, situated on the site of the state roadways in the NEP ROW, may be utilized to ensure safe installation, locations of such structures are still under review. The installation could temporarily affect traffic flow of the roadway but does not involve permanent physical modifications to the roadway. In addition, an access road from the highway to the ROW is proposed as is the installation of several structures within the highway layout.

Project Mitigation: Mitigation was considered as a matter of course during the planning and design process as an overall approach to avoiding impacts whenever possible. In terms of mitigation during construction, NEP has established procedures that are to be followed by all NEP employees and its contractors for accessing sites and performing construction activities on NEP transmission ROWs. These procedures ensure that this Project will be completed in accordance with all applicable environmental laws and regulations as well as with NEP policies and compliance objectives.

MassDOT’s Districts 2 and 3 will be contacted to discuss specific design information and anticipated Project activities within highway jurisdiction. With MassDOT input, a Traffic Management Plan will be developed and submitted for review and approval prior to the start of construction. Enforceable commitments in the Traffic Management Plan will be carried out by NEP to ensure that all proposed traffic mitigation strategies will be implemented as the Project proceeds. Such strategies may include, as appropriate, traffic management procedures; construction time restrictions; signage; installation of track pads to minimize soil in roadways; and/or restoration of vegetation along soft shoulders after construction. All work will occur in accordance with NEP Guidance Document for ROW Access, Maintenance and Construction Best Management Practices.

Findings: After the draft findings herein have been reviewed by Massachusetts Department of Transportation, and revised by the Proponent, as appropriate, the Massachusetts Department of Transportation will make a finding that the foregoing information adequately describes the traffic impacts

NEW ENGLAND POWER COMPANY
A1/B2 ACR PROJECT MEPA EENF NARRATIVE

associated with the proposed Project, and that with the implementation of the mitigation measures described above, all feasible means will have been taken to avoid or minimize adverse environmental impacts subject to Massachusetts Department of Transportation's authority. Appropriate conditions consistent with this Section 61 Finding are included in the State Permit to Access State Highway, and Permanent Access Permit within the Highway Layout issued by Massachusetts Department of Transportation to describe more fully and ensure implementation of said measures.

Proposed Section 61 Findings for Natural Heritage and Endangered Species (NHESP)

DRAFT FINDINGS PURSUANT TO G.L. CHAPTER 30, SECTION 61

Project Name: A1/B2 Transmission Lines Asset Condition Refurbishment Project

Project Location: Warwick, Royalston, Winchendon, Gardner, Westminster, Fitchburg, Leominster, Athol, and Sterling.

Project Proponent: New England Power Company (“NEP”)

EOEA Number: To Be Determined

Agency Action: Conservation and Management Permit from the Natural Heritage and Endangered Species Program of the Massachusetts Division of Fisheries and Wildlife under 321 CMR 10.23.

Intent of These Section 61 Findings: MEPA regulations 301 CMR 11.12(5) stipulate that in “accordance with G.L. c. 30, §61, any Agency that takes Agency Action on a Project for which the Secretary required an EIR shall determine whether the Project is likely, directly or indirectly, to cause any damage to the environment and make a finding describing the damage to the environment and confirming that all feasible measures have been taken to avoid or minimize the damage to the environment.” The Section 61 Findings are incorporated into the conditions or restrictions to the relevant permit or authorization. The following proposed Section 61 Findings have been prepared by the Project Proponent and are intended to assist the state permit-issuing agency in fulfilling its obligations in accordance with G.L. c. 30, §61. These Findings are limited to the subject matter jurisdiction of the Conservation and Management Permit (“CMP”) sought from the Natural Heritage and Endangered Species Program of the Massachusetts Division of Fisheries and Wildlife under 321 CMR 10.23.

Project Description: The Project includes complete refurbishment of 54 miles of 69 kV Transmission Line assets including structures replacements and installations, access improvements or re-establishment and construction of new access, and vegetation cutting. New construction is proposed for this Project.

Comprehensive inspections have identified structures and wires are in need of replacement due to asset condition and aging infrastructure, and lack of safe access for maintenance and emergency needs. From a safety and reliability perspective, in order to extend asset life, the following activities are proposed:

- Replacement of 711 structures
- Installation of approximately 305 concrete caisson foundations
- Installation of six (6) new vertical jumper switch structures
- Reconductoring of both circuits with 795 Aluminum-conductor steel-supported conductor (ACSS), installation of two (2) OPGW
- Construction of new and/or re-establishment of access roads
- Relocation of ~5.2 miles of centerline, approximately 41.5-ft north towards the I135S/J136S Transmission Lines within an existing ROW, in Leominster.
- ROW vegetation cutting to obtain a minimum horizontal clearance of 30-ft to the edge of ROW/easement under all horizontal clearance weather conditions. On average, the existing ROW vegetation cutting is 85-ft. The ROW will be cleared to 100-ft on the mainline and Crystal Lake Tap Line and 125-ft Athol Tap Line to obtain the necessary horizontal clearance requirements.
- Tree removals to accommodate construction access.

In addition, the existing shield wire will be replaced by OPGW to provide high speed communications between substations. NEP is the process of consulting with NHESP pursuant to MESA (G.L. c. 131A) and WPA (G.L. c. 131, §40) to avoid impacts to listed species and their habitat, and to provide mitigation for any unavoidable impacts. Although impacts will be avoided and minimized to the maximum practicable extent without compromising the safety of Project construction and future maintenance personnel, there is some potential “take”. A CMP will be provided, if required.

MEPA History: Pursuant to G.L. c. 30, §61- §62A-H, of the Massachusetts Environmental Policy Act (“MEPA”) and its implementing regulations at 301 CMR 11.00, the Proponent (“NEP”) has prepared and submitted this Expanded ENF to MEPA. The Expanded ENF is the first MEPA filing associated with this Project. The Project is subject to MEPA review as it requires one or more state permits and exceeds the following thresholds requiring the filing of an:

- ENF and an EIR for Wetlands, Waterways and Tidelands because a permit is required, and there is expected to be alteration of one or more acres of bordering vegetated wetlands (301 CMR 11.03(3)(a)(1)(a)).
- EIR for Land because there is expected to alter 50 or more acres of land (301 CMR 11.03(1)(1)).
- EIR for Wetlands, Waterways and Tidelands because a permit is required, and there is expected to be an alteration of ten or more acres of other wetlands (301 CMR 11.03(3)(a)(1)(b)).
- EIR for Environmental Justice Populations as the Project is located within a Designated Geographic Area around an Environmental Justice Population (301 CMR 11.06(7)(b)).

Additionally, the proposed Project requires state permits from 401 Water Quality Certification, Natural Heritage and Endangered Species, Department of Conservation and Recreation, Massachusetts Department of Waterways, Energy Facilities Siting Board, Department of Public Utilities, Massachusetts Department of Environmental Protection and Massachusetts Department of Transportation.

Project Impacts: Impacts relative to the CMP include a potential “take” due to activities proposed within protected species habitat.

Project Mitigation: Mitigation was considered as a matter of course during the planning and design process as an overall approach to avoiding impacts whenever possible. In terms of mitigation during construction, NEP has established procedures that are to be followed by all NEP employees and its contractors for accessing sites and performing construction activities on transmission ROWs. These procedures ensure that this Project will be completed in accordance with all applicable environmental laws and regulations as well as with NEP policies and compliance objectives. NEP completed field investigations and a constructability review along the Project Route to determine access routes, clearing techniques, and construction techniques to be implemented during construction of the Project to provide an accurate impact assessment and to design work to avoid and minimize impacts within sensitive resources to the greatest extent practicable.

NEP is working closely with NHESP and consultation is ongoing. The Project will implement the necessary actions to avoid, minimize, and mitigate Project-related impacts to comply with the MESA permit issued for the Project.

A detailed mitigation plan will be prepared in conjunction with NHESP during the MESA Review in 2022.

Findings: After the draft findings herein have been reviewed by Massachusetts Division of Fisheries and Wildlife, NHESP, and revised by the Proponent, as appropriate, the NHESP will make a finding that the foregoing information adequately describes the environmental impacts associated with the proposed

Project, and that with the implementation of the mitigation measures described above, all feasible means will have been taken to avoid or minimize adverse environmental impacts subject to NHESP authority.

Proposed Section 61 Findings for Department of Conservation and Recreation (DCR)

DRAFT FINDINGS PURSUANT TO G.L. CHAPTER 30, SECTION 61

Project Name: A1/B2 Transmission Lines Asset Condition Refurbishment Project

Project Location: Warwick, Royalston, Winchendon, Gardner, Westminster, Fitchburg, Leominster, Athol, and Sterling.

Project Proponent: New England Power Company (“NEP”)

EOEA Number: To Be Determined

Agency Action: Department of Conservation and Recreation Construction Access Permits

Intent of These Section 61 Findings: MEPA regulations 301 CMR 11.12(5) stipulate that in “accordance with G.L. c. 30, §61, any Agency that takes Agency Action on a Project for which the Secretary required an EIR shall determine whether the Project is likely, directly or indirectly, to cause any damage to the environment and make a finding describing the damage to the environment and confirming that all feasible measures have been taken to avoid or minimize the damage to the environment.” The Section 61 Findings are incorporated into the conditions or restrictions to the relevant permit or authorization. The following proposed Section 61 Findings have been prepared by the Project Proponent and are intended to assist the state permit-issuing agency in fulfilling its obligations in accordance with G.L. c. 30, §61. These Findings are limited to the subject matter jurisdiction of the Construction Access Permit sought from the Massachusetts DCR.

Project Description: The Project includes complete refurbishment of 54 miles of 69 kV Transmission Line assets including structures replacements and installations, access improvements or re-establishment and construction of new access, and vegetation cutting. New construction is proposed for this Project.

Comprehensive inspections have identified structures and wires are in need of replacement due to asset condition and aging infrastructure, and lack of safe access for maintenance and emergency needs. From a safety and reliability perspective, in order to extend asset life, the following activities are proposed:

- Replacement of 711 structures
- Installation of approximately 305 concrete caisson foundations
- Installation of six (6) new vertical jumper switch structures
- Reconductoring of both circuits with 795 Aluminum-conductor steel-supported conductor (ACSS), installation of two (2) OPGW
- Construction of new and/or re-establishment of access roads
- Relocation of ~5.2 miles of centerline, approximately 41.5-ft north towards the I135S/J136S Transmission Lines within an existing ROW, in Leominster.
- ROW vegetation cutting to obtain a minimum horizontal clearance of 30-ft to the edge of ROW/easement under all horizontal clearance weather conditions. On average, the existing ROW vegetation cutting is 85-ft. The ROW will be cleared to 100-ft on the mainline and Crystal Lake Tap Line and 125-ft Athol Tap Line to obtain the necessary horizontal clearance requirements.
- Tree removals to accommodate construction access.

In addition, the existing shield wire will be replaced with OPGW to provide high speed communications between substations. The Project includes on and off-ROW tree removal and construction activities on

DCR properties of the Commonwealth under the care, custody, and control of the DCR under 302 CMR 11.00.

MEPA History: Pursuant to G.L. c. 30, §61- §62A-H, of the Massachusetts Environmental Policy Act (“MEPA”) and its implementing regulations at 301 CMR 11.00, the Proponent (“NEP”) has prepared and submitted this Expanded ENF to MEPA. The Expanded ENF is the first MEPA filing associated with this Project. The Project is subject to MEPA review as it requires one or more state permits and exceeds the following thresholds requiring the filing of an:

- ENF and an EIR for Wetlands, Waterways and Tidelands because a permit is required, and there is expected to be alteration of one or more acres of bordering vegetated wetlands (301 CMR 11.03(3)(a)(1)(a)).
- EIR for Land because there is expected to alter 50 or more acres of land (301 CMR 11.03(1)(1)).
- EIR for Wetlands, Waterways and Tidelands because a permit is required, and there is expected to be an alteration of ten or more acres of other wetlands (301 CMR 11.03(3)(a)(1)(b)).
- EIR for Environmental Justice Populations as the Project is located within a Designated Geographic Area around an Environmental Justice Population (301 CMR 11.06(7)(b)).

Additionally, the proposed Project requires state permits from the 401 Water Quality Certification, Natural Heritage and Endangered Species, Department of Conservation and Recreation, Massachusetts Department of Waterways, Energy Facilities Siting Board, Department of Public Utilities, Massachusetts Department of Environmental Protection and Massachusetts Department of Transportation.

Project Impacts: Impacts relative to the DCR Construction Access Permits include tree removals, access road construction and structure replacement containing concrete caissons at 14 structures within DCR properties.

Project Mitigation: Mitigation was considered as a matter of course during the planning and design process as an overall approach to avoiding impacts whenever possible. In terms of mitigation during construction, NEP has established procedures that are to be followed by all NEP employees and its contractors for accessing sites and performing construction activities on transmission ROWs. These procedures ensure that this Project will be completed in accordance with all applicable environmental laws and regulations as well as with NEP policies and compliance objectives. NEP completed field investigations and a constructability review along the Project Route to determine access routes, clearing techniques, and construction techniques to be implemented during construction of the Project to provide an accurate impact assessment and to design work to avoid and minimize impacts within sensitive resources to the greatest extent practicable.

At this time, proposed mitigation may include, but is not limited to, the following:

- Any and all work will be conducted according to the Construction Access Permit terms and conditions, to the satisfaction of the Department.
- All work will be performed in accordance with applicable statutes, regulations, codes or standards.

A detailed mitigation plan will be prepared in conjunction with the anticipated filing of DCR Permits in 2023. Coordination with DCR is ongoing.

Findings: After the draft findings herein have been reviewed by DCR, and revised by the Proponent, as appropriate, the DCR will make a finding that the foregoing information adequately describes the environmental impacts associated with the proposed Project, and that with the implementation of the mitigation measures described above, all feasible means will have been taken to avoid or minimize adverse environmental impacts subject to DCR authority.

Proposed Section 61 Findings Executive Office of Energy and Environmental Affairs Environmental Justice
DRAFT FINDINGS PURSUANT TO G.L. CHAPTER 30, SECTION 61

Project Name: A1/B2 Transmission Lines Asset Condition Refurbishment Project

Project Location: Warwick, Royalston, Winchendon, Gardner, Westminster, Fitchburg, Leominster, Athol, and Sterling.

Project Proponent: New England Power Company (“NEP”)

EOEA Number: To Be Determined

Agency Action: Executive Office of Energy and Environmental Affairs (“EOEEA”) - Environmental Justice

Intent of These Section 61 Findings: MEPA regulations 301 CMR 11.12(5) stipulate that in “accordance with G.L. c. 30, §61, any Agency that takes Agency Action on a Project for which the Secretary required an EIR shall determine whether the Project is likely, directly or indirectly, to cause any damage to the environment and make a finding describing the damage to the environment and confirming that all feasible measures have been taken to avoid or minimize the damage to the environment.” The Section 61 Findings are incorporated into the conditions or restrictions to the relevant permit or authorization. The following proposed Section 61 Findings have been prepared by the Project Proponent and are intended to assist the state permit-issuing agency in fulfilling its obligations in accordance with G.L. c. 30, §61. These Findings are limited to the subject matter jurisdiction of the MEPA Interim Protocol for Analysis of Environmental Justice (EJ) Impacts, which implements requirements related to the content of Environmental Impact Reports (EIRs) as set forth in Section 58 of the Act.

Project Description: Project Description: The Project includes complete refurbishment of 54 miles of 69 kV Transmission Line assets including structures replacements and installations, access improvements or re-establishment and construction of new access, and vegetation cutting. New construction is proposed for this Project.

Comprehensive inspections have identified structures and wires are in need of replacement due to asset condition and aging infrastructure, and lack of safe access for maintenance and emergency needs. From a safety and reliability perspective, in order to extend asset life, the following activities are proposed:

- Replacement of 711 structures
- Installation of approximately 305 concrete caisson foundations
- Installation of six (6) new vertical jumper switch structures
- Reconductoring of both circuits with 795 Aluminum-conductor steel-supported conductor (“ACSS”), installation of two (2) OPGW
- Construction of new and/or re-establishment of access roads
- Relocation of ~5.2 miles of centerline, approximately 41.5-ft north towards the I135S/J136S Transmission Lines within an existing ROW, in Leominster.
- ROW vegetation cutting to obtain a minimum horizontal clearance of 30-ft to the edge of ROW/easement under all horizontal clearance weather conditions. On average, the existing ROW vegetation cutting is 85-ft. The ROW will be cleared to 100-ft on the mainline and Crystal Lake Tap Line and 125-ft Athol Tap Line to obtain the necessary horizontal clearance requirements.
- Tree removals to accommodate construction access.

In addition, the existing shield wire will be replaced with OPGW to provide high speed communications between substations.

MEPA History: Pursuant to G.L. c. 30, §61- §62A-H, of the Massachusetts Environmental Policy Act (“MEPA”) and its implementing regulations at 301 CMR 11.00, the Proponent (“NEP”) has prepared and submitted this Expanded ENF to MEPA. The Expanded ENF is the first MEPA filing associated with this Project. The Project is subject to MEPA review as it requires one or more state permits and exceeds the following thresholds requiring the filing of an:

- ENF and an EIR for Wetlands, Waterways and Tidelands because a permit is required, and there is expected to be alteration of one or more acres of bordering vegetated wetlands (301 CMR 11.03(3)(a)(1)(a)).
- EIR for Land because there is expected to alter 50 or more acres of land (301 CMR 11.03(1)(1)).
- EIR for Wetlands, Waterways and Tidelands because a permit is required, and there is expected to be an alteration of ten or more acres of other wetlands (301 CMR 11.03(3)(a)(1)(b)).
- EIR for Environmental Justice Populations as the Project is located within a Designated Geographic Area around an Environmental Justice Population (301 CMR 11.06(7)(b)).

Additionally, the proposed Project requires state permits from the 401 Water Quality Certification, Natural Heritage and Endangered Species, Department of Conservation and Recreation, Massachusetts Department of Waterways, Energy Facilities Siting Board, Department of Public Utilities, Massachusetts Department of Environmental Protection and Massachusetts Department of Transportation.

Project Impacts: Impacts relative to the EOEEA EJ Populations include approximately 24 acres of tree removal within the EJ Populations, 29 acres of cut/fill associated with establishment of access roads, work envelopes and pull pads, and 322 lf of Standard Road Type 1 & 2, and 19,054 lf of Designed Road Type 3-5. In total, 10% of Project impacts are located within the EJ Populations, which represents 10% of the Project ROW, whereas 90% of Project impacts are within non-EJ Populations, which represents 90% of the Project Right-of-Way (ROW). Therefore, NEP anticipates that the Project will not have unfair or inequitable impacts on the EJ Populations within the designated geographic area.

Project Mitigation: The Project will occur within the existing ROW, thereby minimizing adverse environmental impacts to the nature of the Project, outage constraints in the region, and NEP’s efforts to reduce impacts to the natural and human environment, Project activities will be sequenced in both the mainline and tap lines. No long-term impacts on soil, bedrock, vegetation, surface water, groundwater, wetland resources or air quality will occur. Any potential sedimentation impacts, and other short-term construction impacts to wetlands and surface waters, will be mitigated through the use of soil erosion and sediment control BMPs and temporary construction mats to protect wetland soils, vegetation root stock, and streams. As part of the Project, an Environmental Monitor will be part of the Project team to ensure compliance with all regulatory programs and permit conditions, and to oversee the proper installation and maintenance of the soil erosion and sediment control BMPs.

At this time, proposed mitigation includes, but is not limited to, the following:

Air Quality

Construction-period activities, such as grading, roadbuilding, vehicle travel, and other earth-disturbing work may result in a temporary increase in airborne dust. Impacts to air quality will be minimized by managing the control of dust movement with practices such as spreading wood mulch or straw and using water trucks to spray dried soil to keep it moist. The potential for dust generation is only anticipated during the construction period. Post construction, soil will be stabilized and re-vegetated.

In addition, diesel-powered equipment is required to use ultra-low sulfur diesel fuel. Any diesel-powered non-road construction equipment rated 50-horsepower or more that will be used on the Project for 30 days or more will be required to install emission control devices. The impacts from these emissions will be minimal and are not anticipated to cause impacts to public health. Additionally, idling times are limited to five (5) minutes except when engine power is necessary for the delivery of materials or to operate accessories to the vehicle such as power lifts. Vehicle idling is to be minimized during construction activities and be in compliance with the Massachusetts Anti-idling Law, G.L. c. 90 § 16A, c. 111 §§ 142A – 142M, and 310 CMR 7.11.

Water Quality

The project will incorporate protective and preventative measures to minimize and avoid impacts to water quality. The ROWs cross many wetland areas, streams and rivers. To protect water quality and these sensitive areas, temporary roads will be constructed using construction mats. Construction mats are comprised of wooden beams, bolted together, and are typically 4-ft wide by 16-ft long. They are laid temporarily on top of the ground and vegetation. These mats allow heavy machines and vehicles to cross sensitive areas without damaging the soil or roots of vegetation and are also placed in a manner that do not affect the flow of water in streams. These mats will be removed when construction is completed, and the wetlands will be restored. In addition, BMPs, such as the use of straw wattles, silt fencing, stormwater management features, and other control measures will be used to prevent soil and other material from being transported into wetlands and streams. Using these BMPs, any impacts to water quality will be negligible and temporary and are not anticipated to cause impacts to public health.

Land Protection and Open Space

Project activities will be limited to the existing ROW. Access to Protected Land and Open Space within EJ Populations will not be impacted.

Noise

Noise impacts associated with construction-period activities are temporary in nature and expected to be minimal. Where construction will occur adjacent to residences, NEP will notify landowners prior to the commencement of work. Noise-generating activities will be conducted in accordance with any local and state requirements and are not anticipated to cause impacts to public health.

Traffic

Impacts to traffic during the construction of the Project will be minor and intermittent. The work areas will be accessed primarily from NEP-owned access routes or minor town roadways. NEP will obtain the necessary permits from Massachusetts Department of Transportation for access. Once on-site, vehicle traffic will be limited to within or in proximity to the ROW. Since the ROW is an un-manned facility, there will be no permanent impacts to traffic patterns or use of existing roadways and no impacts to public health are anticipated from traffic.

Findings:

After the draft findings herein have been reviewed by the EOEEA - EJ Program, and revised by the Proponent, as appropriate, the EOEEA - EJ Program will make a finding that the foregoing information adequately describes the environmental impacts to the EJ Populations associated with the proposed Project, and that with the implementation of the mitigation measures described above, all feasible means will have been taken to avoid or minimize adverse environmental impacts subject to EOEEA's EJ authority.

Proposed Section 61 Findings Climate Protocol
DRAFT FINDINGS PURSUANT TO G.L. CHAPTER 30, SECTION 61

Project Name: A1/B2 Transmission Lines Asset Condition Refurbishment Project

Project Location: Warwick, Royalston, Winchendon, Gardner, Westminster, Fitchburg, Leominster, Athol, and Sterling.

Project Proponent: New England Power Company (“NEP”)

EOEA Number: To Be Determined

Agency Action: Executive Office of Energy and Environmental Affairs (“EOEEA”) - Climate Change

Intent of These Section 61 Findings: MEPA regulations 301 CMR 11.12(5) stipulate that in “accordance with G.L. c. 30, §61, any Agency that takes Agency Action on a Project for which the Secretary required an EIR shall determine whether the Project is likely, directly or indirectly, to cause any damage to the environment and make a finding describing the damage to the environment and confirming that all feasible measures have been taken to avoid or minimize the damage to the environment.” The Section 61 Findings are incorporated into the conditions or restrictions to the relevant permit or authorization. The following proposed Section 61 Findings have been prepared by the Project Proponent and are intended to assist the state permit-issuing agency in fulfilling its obligations in accordance with G.L. c. 30, §61. These Findings are limited to the subject matter jurisdiction of the Massachusetts Environmental Policy Act (“MEPA”) Interim Protocol on Climate Change Adaptation and Resiliency (“Interim Protocol”) which complies with Executive Order 569.

Project Description: Project Description: The Project includes complete refurbishment of 54 miles of 69 kV Transmission Line assets including structures replacements and installations, access improvements or re-establishment and construction of new access, and vegetation cutting. New construction is proposed for this Project.

Comprehensive inspections have identified structures and wires are in need of replacement due to asset condition and aging infrastructure, and lack of safe access for maintenance and emergency needs. From a safety and reliability perspective, in order to extend asset life, the following activities are proposed:

- Replacement of 711 structures
- Installation of approximately 305 concrete caisson foundations
- Installation of six (6) new vertical jumper switch structures
- Reconductoring of both circuits with 795 Aluminum-conductor steel-supported conductor (“ACSS”), installation of two (2) OPGW
- Construction of new and/or re-establishment of access roads
- Relocation of ~5.2 miles of centerline, approximately 41.5-ft north towards the I135S/J136S Transmission Lines within an existing ROW, in Leominster.
- ROW vegetation cutting to obtain a minimum horizontal clearance of 30-ft to the edge of ROW/easement under all horizontal clearance weather conditions. On average, the existing ROW vegetation cutting is 85-ft. The ROW will be cleared to 100-ft on the mainline and Crystal Lake Tap Line and 125-ft Athol Tap Line to obtain the necessary horizontal clearance requirements.
- Tree removals to accommodate construction access.

In addition, the existing shield wire will be replaced with OPGW to provide high speed communications between substations.

MEPA History: Pursuant to G.L. c. 30, §61- §62A-H, of the Massachusetts Environmental Policy Act (“MEPA”) and its implementing regulations at 301 CMR 11.00, the Proponent (“NEP”) has prepared and submitted this Expanded ENF to MEPA. The Expanded ENF is the first MEPA filing associated with this Project. The Project is subject to MEPA review as it requires one or more state permits and exceeds the following thresholds requiring the filing of an:

- ENF and an EIR for Wetlands, Waterways and Tidelands because a permit is required, and there is expected to be alteration of one or more acres of bordering vegetated wetlands (301 CMR 11.03(3)(a)(1)(a)).
- EIR for Land because there is expected to alter 50 or more acres of land (301 CMR 11.03(1)(1)).
- EIR for Wetlands, Waterways and Tidelands because a permit is required, and there is expected to be an alteration of ten or more acres of other wetlands (301 CMR 11.03(3)(a)(1)(b)).
- EIR for Environmental Justice Populations as the Project is located within a Designated Geographic Area around an Environmental Justice Population (301 CMR 11.06(7)(b)).

Additionally, the proposed Project requires state permits from the 401 Water Quality Certification, Natural Heritage and Endangered Species, Department of Conservation and Recreation, Massachusetts Department of Waterways, Energy Facilities Siting Board, Department of Public Utilities, Massachusetts Department of Environmental Protection and Massachusetts Department of Transportation.

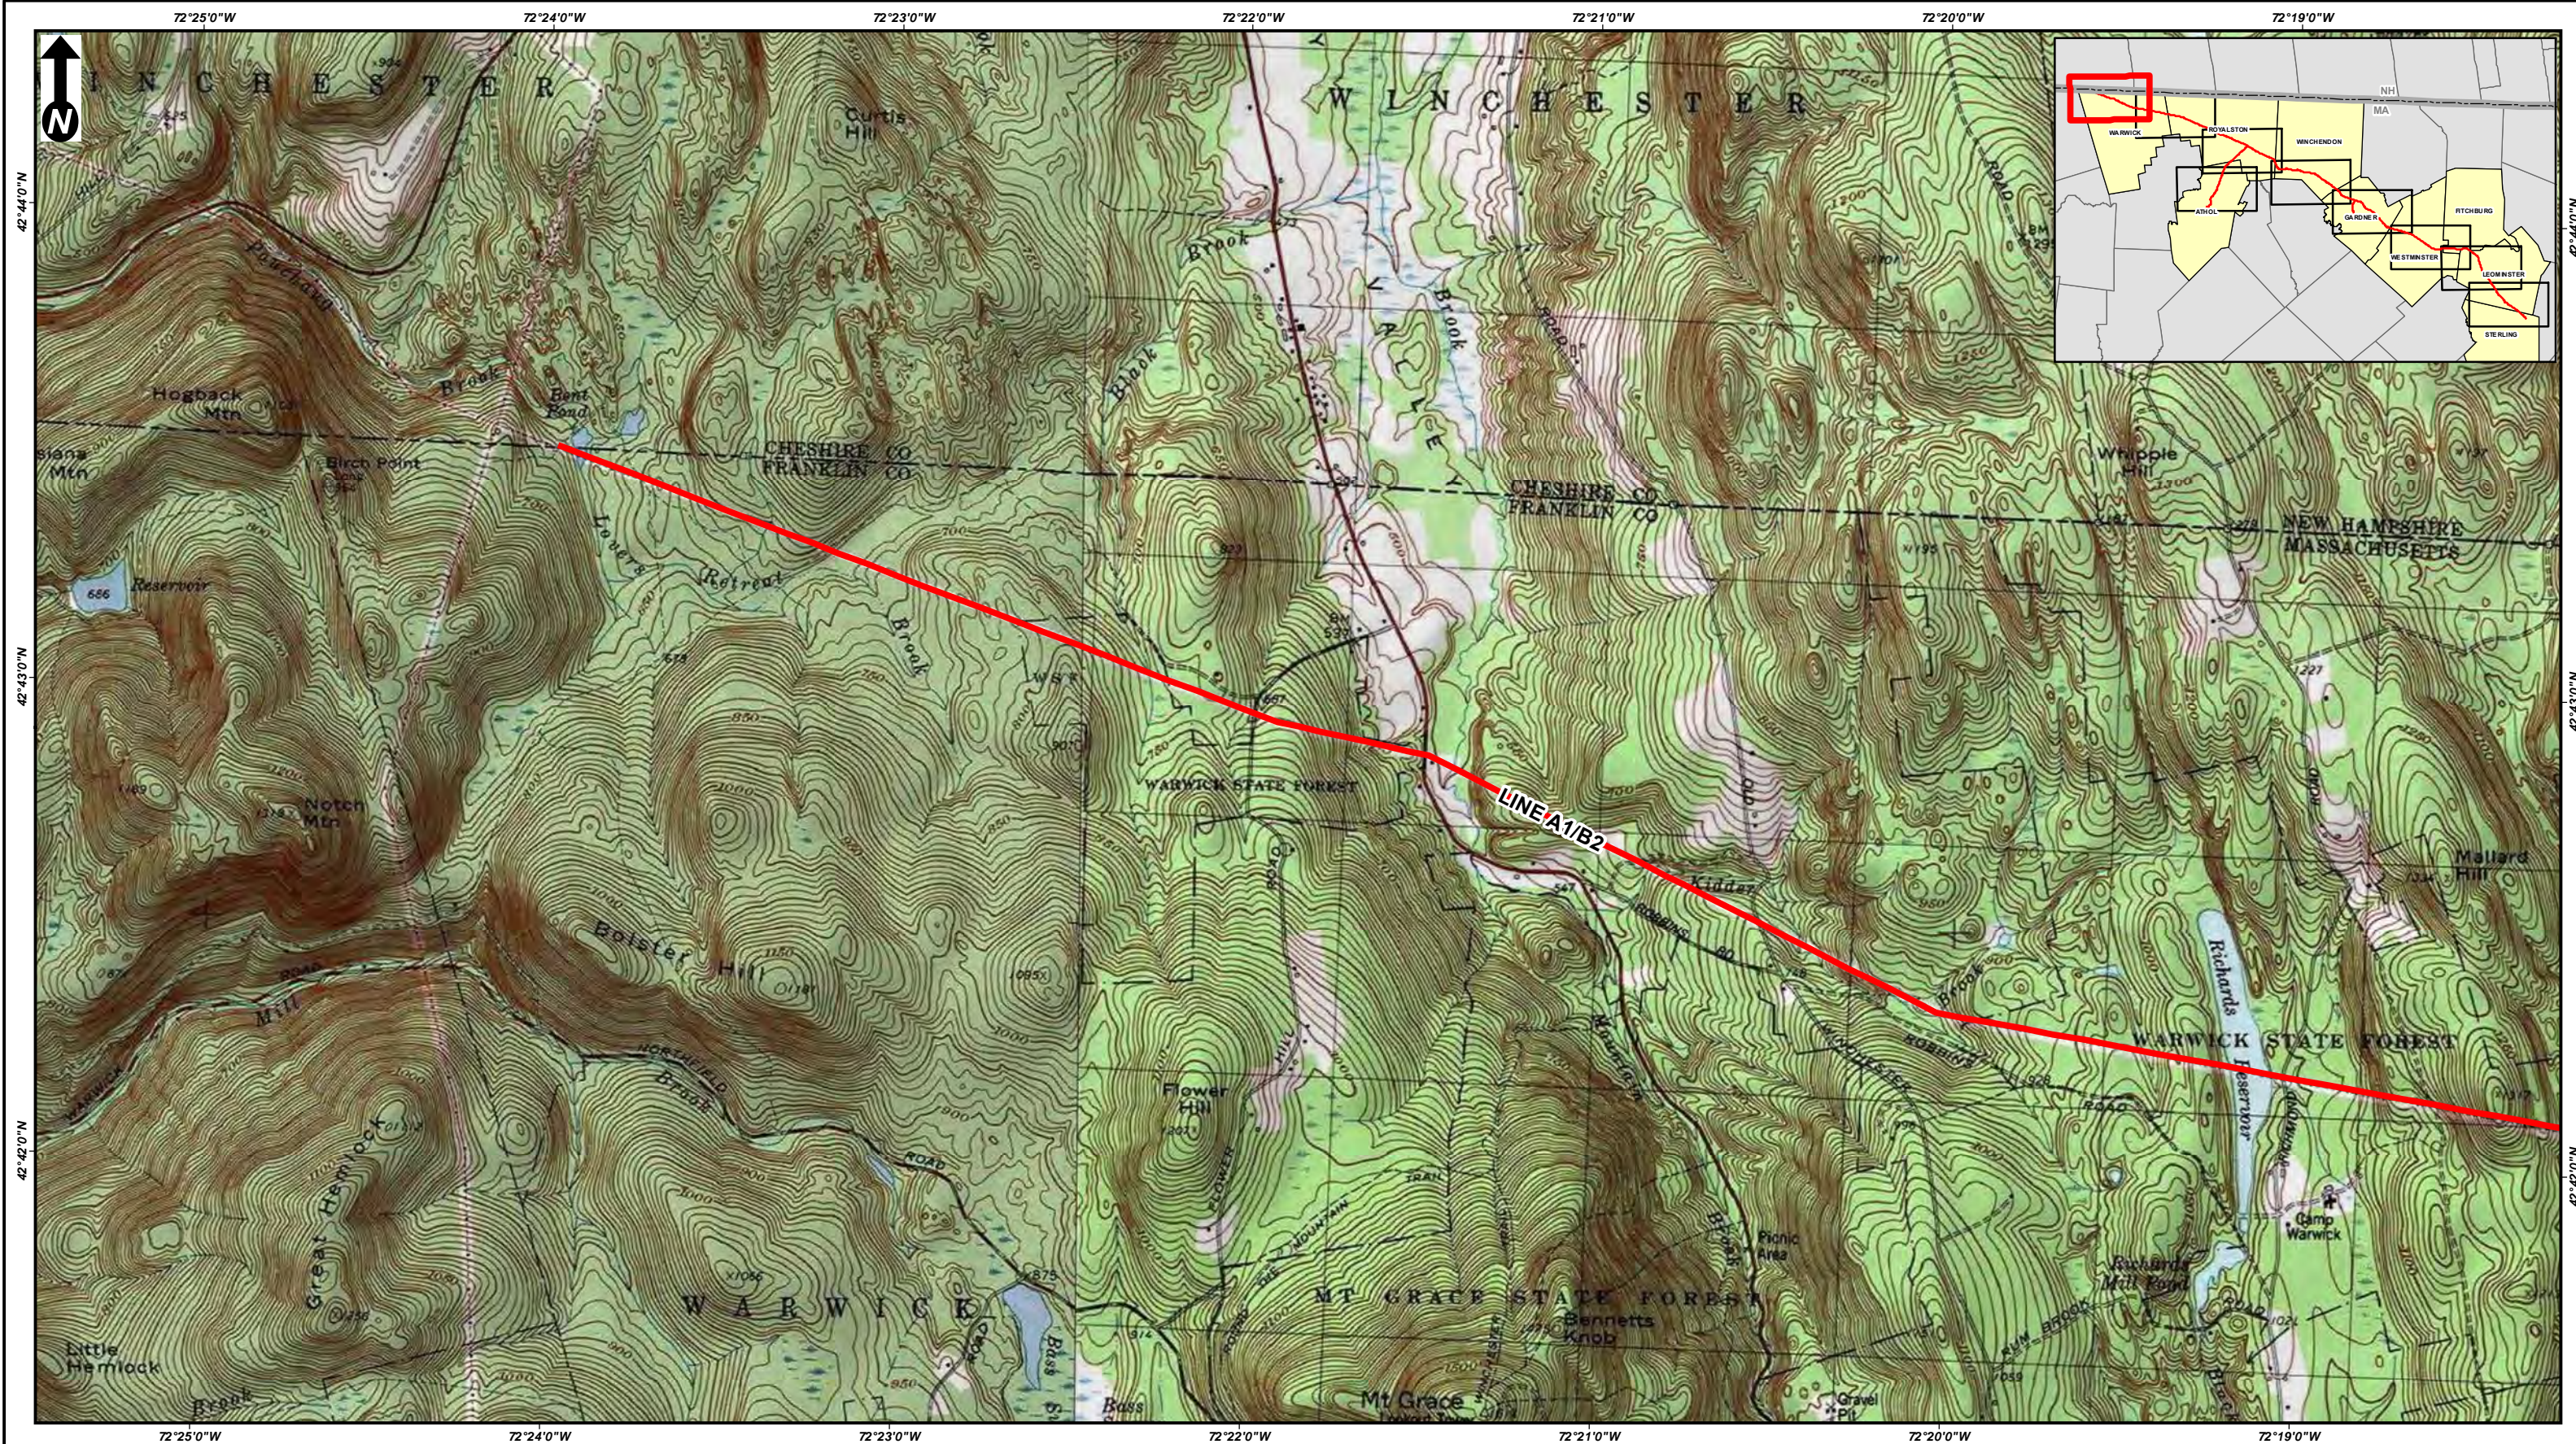

Project Impacts: Impacts relative to the Massachusetts Department of Energy Resources Climate Change include Project asset impacts of high exposure to Extreme Precipitation - Urban Flooding, Extreme Precipitation - Riverine Flooding and Extreme Heat.

Project Mitigation: The Project has incorporated measures that seek to reduce potential vulnerability to anticipated climate risks and improve resiliency for future climate conditions. The EOEEA Climate Change and Adaptation Report (Report) documents that with increasing temperatures as a result of climate change, electricity demand in the Commonwealth could increase by 40 percent in 2030. The Massachusetts State Hazard Mitigation & Climate Adaptation Plan states in its risk assessment, that, “in addition to increasing demand for heating and cooling, periods of both hot and cold weather can stress energy infrastructure...Electricity consumption during summer may reach three times the average consumption rate of the period between 1960 and 2000; more than 25 percent of this consumption may be attributable to climate change.”³⁶ The Report identifies that without reliable energy service, the basic needs of residents, visitors, businesses, and governments cannot be met. The Project, which is designed to improve reliable energy service within the region, serves this overall purpose.

NEP has taken steps to promote climate change adaptation and resiliency in the design of the Project and continues to consider climate change and long-term infrastructure resiliency an important goal in its long-term infrastructure planning. The Project will result in a more climate-ready and resilient transmission system that can withstand more extreme weather events; address existing system capacity shortages and increased demand; and support future interconnections from renewable energy projects. In addition, NEP’s preferred solution uses substantial portions of the existing ROW, thereby minimizing alteration of new land resources to construct the Project. The purpose of the Project is to address existing asset conditions along the A1/B2 Lines that pose a threat to electrical reliability.

³⁶ EOEEA, 2011 as cited in Massachusetts State Hazard Mitigation and Climate Action Plan, 2018, p. 265. Retrieved 6/14/2022, <https://resilientma.org/shmcap-portal/static/media/SHMCAP-September2018-Full-Plan-web.286acceeb.pdf#page=90>

Findings: After the draft findings herein have been reviewed by the EOEEA - Climate Change Program, and revised by the Proponent, as appropriate, the EOEEA - Climate Change Program will make a finding that the foregoing information adequately describes the environmental impacts to the climate associated with the proposed Project, and that with the implementation of the mitigation measures described above, all feasible means will have been taken to avoid or minimize adverse climate impacts subject to the MEPA Interim Protocol on Climate Change Adaptation and Resiliency.

The LOD will be refined as the planning process continues and landowner coordination will be conducted as necessary.

Resource Areas Reviewed:
 MADEP Tier Classified Oil and/or Hazardous Material Sites (21E); MADEP Oil and/or Hazardous Material Sites with Activity and Use Limitations; Certified Vernal Pools; Potential Vernal Pools; NHESP Priority Habitats; NHESP Estimated Habitats; NHESP Restricted Data; Hydrography; MADEP Hydrologic Connections; MADEP Wetlands; FEMA 100yr Floodplain; Public Water Supply; Zone II Wellhead Protection Area; Interim Wellhead Protection Area; Surface Water Protection Zone; Outstanding Resource Water; Areas of Critical Environmental Concern; Watershed Protection Act Zones; Ch. 91 Tidelands Jurisdiction; Article 97 Land; Landfills ([Not]Capped, [Un]Lined, [In]Active, Closed)

Legend	
Construction Activities	Existing Access
Remove Structure	Existing Tree Line
Install Structure (Concrete Caisson)	Delineated Wetland Edge
Install Structure (Direct Embed)	Delineated Wetland
Install Structure (Vertical Jumper Switch)	Delineated Vernal Pool Extent*
In Kind Direct Embed Structure Replacement	Delineated Top of Bank
In Kind Structure on Concrete Caisson Replacement	Delineated Stream Centerline
Reuse Structure	Delineated Ordinary High Water
General Maintenance	Approximate Top of Bank
Proposed Centerline	Approximate Ordinary High Water
Remove OH Line	Approximate Swale
Standard Road Type 1 & 2	Delineated Open Water*
Designed Road Type 3-5	Approximate Wetland Edge
Work Envelope	Approximate Wetland
Pull Pad	State Streams
Limit of Cut/Fill	State Wetlands*
Limit of Disturbance	State Open Water*
Proposed Retaining Wall	100ft Buffer to Wetlands & Streams
Proposed Tree Removal	200ft Riverfront Area
Best Management Practices	FEMA 100yr Floodplain*
Construction Matting	Certified Vernal Pools
Existing Conditions	Potential Vernal Pools
Existing Structure	NHESP Priority & Estimated Habitats
Other Existing Transmission Centerline	NHESP Restricted Data
Edge of ROW	Delineated Open Water*
Interim Wellhead Protection Area	National Grid Property
Zone II Wellhead Protection Area	Town Boundary
Surface Water Protection Zone	State Boundary
Outstanding Resource Water	Gate
Public Water Supply	Culvert
MADEP (21E) Site	Fence
MADEP AUL Site	Stonewall
Railroad	Guardrail
DCR Trails	Environmental Justice 2020 Populations
Hiking Trails	Minority & Income
Long Distance Trails	Minority
Parcel Boundary	Income

The LOD will be refined as the planning process continues and landowner coordination will be conducted as necessary.

Resource Areas Reviewed:
 MADEP Tier Classified Oil and/or Hazardous Material Sites (21E); MADEP Oil and/or Hazardous Material Sites with Activity and Use Limitations; Certified Vernal Pools; Potential Vernal Pools; NHESP Priority Habitats; NHESP Estimated Habitats; NHESP Restricted Data; Hydrography; MADEP Hydrologic Connections; MADEP Wetlands; FEMA 100yr Floodplain; Public Water Supply; Zone II Wellhead Protection Area; Interim Wellhead Protection Area; Surface Water Protection Zone; Outstanding Resource Water; Areas of Critical Environmental Concern; Watershed Protection Act Zones; Ch. 91 Tidelands Jurisdiction; Article 97 Land; Landfills ([Not]Capped, [Un]Lined, [In]Active, Closed)

Legend	
Construction Activities	Designed Road Type 3-5
Remove Structure	Work Envelope
Install Structure (Concrete Caisson)	Pull Pad
Install Structure (Direct Embed)	Limit of Cut/Fill
Install Structure (Vertical Jumper Switch)	Limit of Disturbance
In Kind Direct Embed Structure Replacement	Proposed Retaining Wall
In Kind Structure on Concrete Caisson Replacement	Proposed Tree Removal
Reuse Structure	Best Management Practices
General Maintenance	Construction Matting
Proposed Centerline	Existing Conditions
Remove OH Line	Existing Structure
Standard Road Type 1 & 2	Other Existing Transmission Centerline
Existing Access	Edge of ROW
Existing Tree Line	Approximate Wetland Edge
Delineated Wetland Edge	Approximate Wetland
Delineated Wetland	State Streams
Delineated Vernal Pool Extent*	State Wetlands*
Delineated Top of Bank	State Open Water*
Delineated Stream Centerline	100ft Buffer to Wetlands & Streams
Delineated Ordinary High Water	200ft Riverfront Area
Approximate Top of Bank	FEMA 100yr Floodplain*
Approximate Ordinary High Water	Certified Vernal Pools
Approximate Swale	Potential Vernal Pools
Delineated Open Water*	NHESP Priority & Estimated Habitats
Interim Wellhead Protection Area	NHESP Restricted Data
Zone II Wellhead Protection Area	National Grid Property
Surface Water Protection Zone	Town Boundary
Outstanding Resource Water	State Boundary
Public Water Supply	Gate
MADEP (21E) Site	Culvert
MADEP AUL Site	Fence
Railroad	Stonewall
DCR Trails	Guardrail
Hiking Trails	Environmental Justice 2020 Populations
Long Distance Trails	Minority & Income
Parcel Boundary	Minority
National Grid Property	Income

The LOD will be refined as the planning process continues and landowner coordination will be conducted as necessary.

Resource Areas Reviewed:
 MADEP Tier Classified Oil and/or Hazardous Material Sites (21E); MADEP Oil and/or Hazardous Material Sites with Activity and Use Limitations; Certified Vernal Pools; Potential Vernal Pools; NHESP Priority Habitats; NHESP Estimated Habitats; NHESP Restricted Data; Hydrography; MADEP Hydrologic Connections; MADEP Wetlands; FEMA 100yr Floodplain; Public Water Supply; Zone II Wellhead Protection Area; Interim Wellhead Protection Area; Surface Water Protection Zone; Outstanding Resource Water; Areas of Critical Environmental Concern; Watershed Protection Act Zones; Ch. 91 Tidelands Jurisdiction; Article 97 Land; Landfills ([Not]Capped, [Un]Lined, [In]Active, Closed)

Construction Activities	
Remove Structure	Designed Road Type 3-5
Work Envelope	Pull Pad
Install Structure (Concrete Caisson)	Limit of Cut/Fill
Install Structure (Direct Embed)	Limit of Disturbance
Install Structure (Vertical Jumper Switch)	Proposed Retaining Wall
In Kind Direct Embed Structure Replacement	Proposed Tree Removal
In Kind Structure on Concrete Caisson Replacement	Best Management Practices
Reuse Structure	Construction Matting
General Maintenance	Existing Conditions
Proposed Centerline	Existing Structure
Remove OH Line	Other Existing Transmission Centerline
Standard Road Type 1 & 2	Approximate Swale
	Edge of ROW

Existing Access	Approximate Wetland Edge
Existing Tree Line	Approximate Wetland
Delineated Wetland Edge	State Streams
Delineated Wetland	State Wetlands*
Delineated Vernal Pool Extent*	State Open Water*
Delineated Top of Bank	100ft Buffer to Wetlands & Streams
Delineated Stream Centerline	200ft Riverfront Area
Delineated Ordinary High Water	FEMA 100yr Floodplain*
Approximate Top of Bank	Certified Vernal Pools
Approximate Ordinary High Water	Potential Vernal Pools
Approximate Swale	NHESP Priority & Estimated Habitats
Delineated Open Water*	NHESP Restricted Data

Interim Wellhead Protection Area	National Grid Property
Zone II Wellhead Protection Area	Town Boundary
Surface Water Protection Zone	State Boundary
Outstanding Resource Water	Gate
Public Water Supply	Culvert
MADEP (21E) Site	Fence
MADEP AUL Site	Stonewall
Railroad	Guardrail
DCR Trails	Article 97 Lands
Hiking Trails	DCR-State Parks & Recreation
Long Distance Trails	Department of Fish & Game
Parcel Boundary	Land Trust
	Municipal
	Private
	Environmental Justice 2020 Populations
	Minority & Income
	Minority
	Income

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	1 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England		REFERENCE EP-3; Natural Resource Protection

PURPOSE/OBJECTIVE:

This document provides National Grid personnel, consultants and contractors with Best Management Practices (BMPs) for conducting work on electric and natural gas transmission and distribution rights-of-ways (ROWs) and substations in New England.

WHO:

These BMPs are to be followed by all personnel conducting work on Company electric and gas ROWs and substations in New England. These BMPs do not apply to Company employees and contractors performing routine vegetation management activities that are not a part of construction or re-construction projects. Employees and contractors maintaining vegetation on Company ROWs and substations must follow the National Grid ROW Vegetation and Substation Vegetation Management Plans.

DEFINITIONS:

Refer to **Glossary** in **Appendix 1** and **Acronyms** in **Appendix 2**.

WHAT TO DO:

1.0 Project Planning

Prior to the start of any project (proposed new facilities or maintenance of existing facilities), the Project Engineer or other project planner shall determine whether any environmental permits or approvals are required, per the state-specific EG-301 environmental checklists. Any questions regarding which activities may be conducted in regulated areas or within environmentally sensitive areas shall be referred to the National Grid Environmental Scientist or Project Environmental Consultant.

All new construction and maintenance projects shall follow clear and enforceable environmental performance standards, which is the purpose for which these BMPs have been compiled.

1.1 Avoidance and Minimization

Measures shall always be taken to avoid impacts to wetlands, waterways, rare species habitats, known below and above ground historical/archeological resources and other environmentally sensitive areas. If avoidance is not possible, then measures shall be taken to minimize the extent of impacts. Alternate access routes or staging areas shall always be considered. Below is a list of methods that shall be considered where impacts are unavoidable:

- Use existing ROW access where available. Keep to approved routes and roads without deviating from them or making them wider.
- Off-ROW access shall never be assumed and shall be coordinated through National Grid Real Estate before being implemented.
- Where no existing ROW access is present, avoid wetlands and if a wetland crossing is necessary, cross wetlands at the most narrow point possible or at the location of a previously used crossing (if evident). Figure 1 below illustrates this minimization technique.

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	2 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England		REFERENCE EP-3; Natural Resource Protection

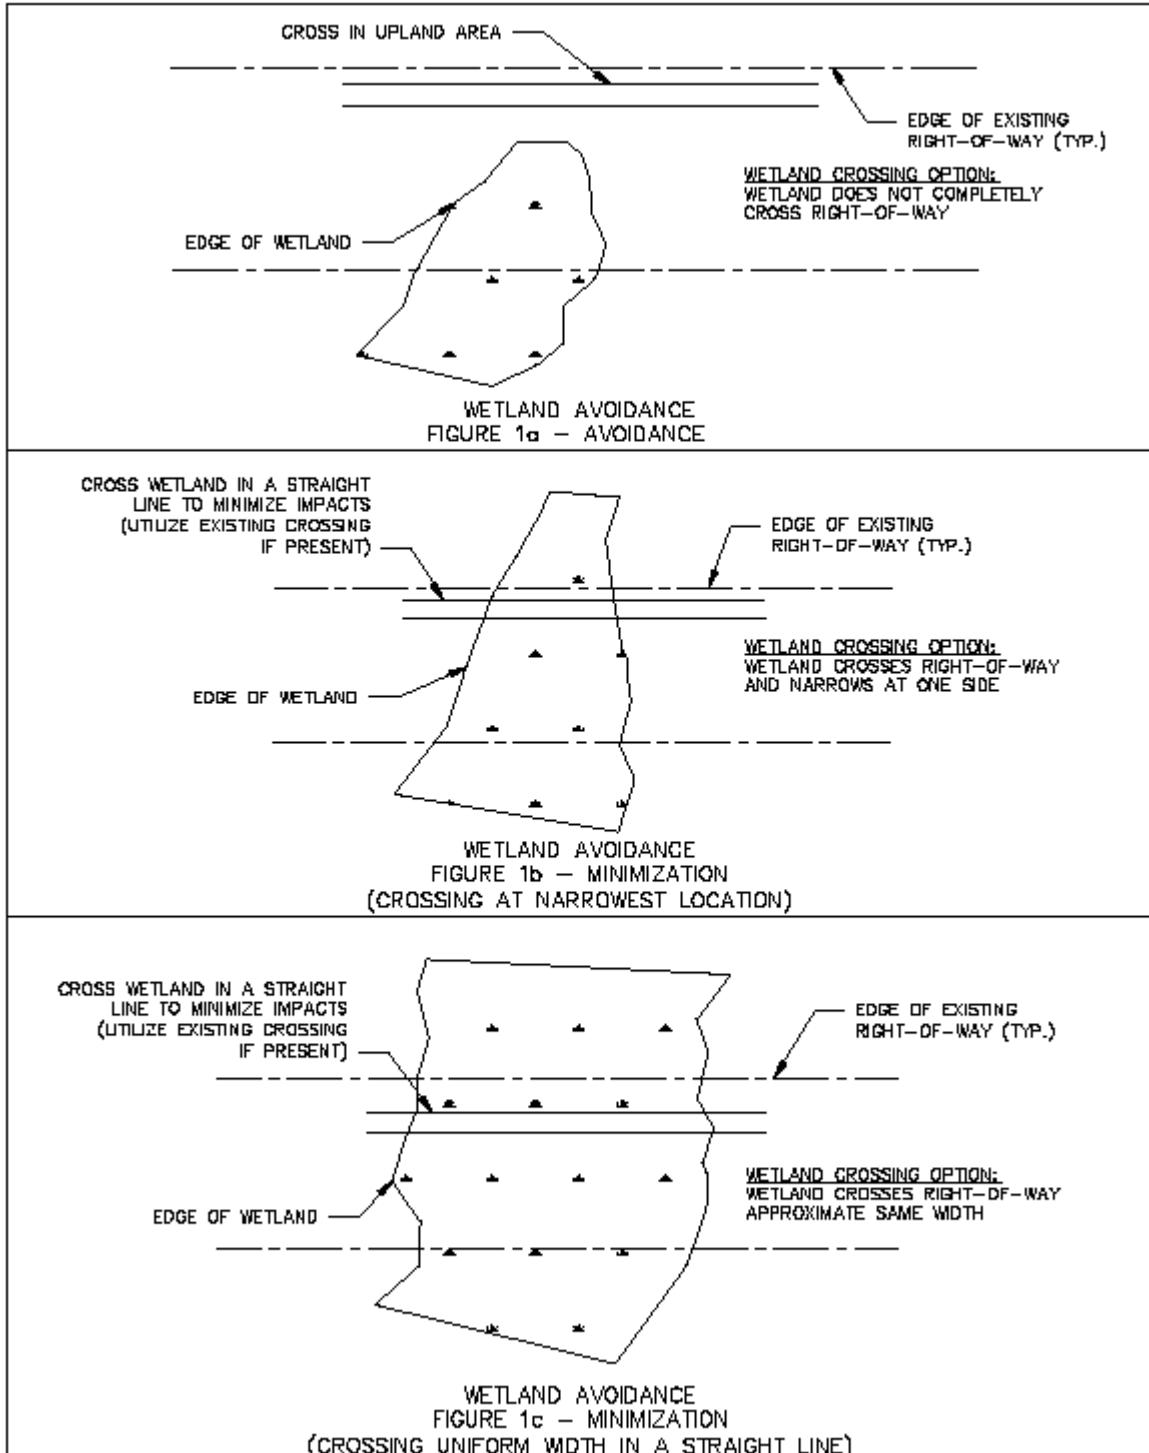

- Avoid and minimize stream crossings.
- Minimize the width of typical access roads through wetlands to a maximum width of 16 feet.
- Conduct work manually (without using motorized equipment) in wetlands, wherever possible.
- Use construction mats in wetlands to minimize soil disturbance and rutting when crossing or working within wetlands. When not using mats for access, standard vehicles shall not be allowed to drive across wetlands without the prior approval of the National Grid Environmental Scientist. Use of a low ground pressure (LGP) vehicle may be a feasible alternative to mats provided that such LGP vehicle use has been reviewed and approved by the National Grid Environmental Scientist. See Section 7.0.
- Coordinate the timing of work to cause the least impacts during the regulatory low-flow period under normal conditions, when water/ground is frozen, after the spring songbird nesting season, and, outside of the anticipated amphibian migration window (mid-February to mid-June). Refer to the United States Army Corps of Engineers (USACE) state-specific General Permit for the definition of the low-flow period in each state at: <http://www.nae.usace.army.mil/Missions/Regulatory/State-General-Permits/>. A summary table is provided in Section 7.0.
- Seek alternative routes or work methods to minimize impact.

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	4 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England		REFERENCE EP-3; Natural Resource Protection

1.2 Historically Significant Areas

Areas that have been identified as historically and/or culturally significant shall be avoided in accordance with site-specific avoidance plans, as applicable. Refer to the project-specific Environmental Field Issue (EFI) for any applicable avoidance plans or consult with the National Grid Environmental Scientist. Demarcation of these areas to be avoided shall use staked orange snow fencing or an equivalent physical barrier (not just ribbon flagging) and signage. Refer to Section 14.0 for signage guidance.

1.3 Rare Species Habitat

Work within areas that have been identified as mapped rare species habitat shall follow site-specific requirements, as applicable. In Massachusetts, maintenance activities within mapped habitat (known as Priority Habitat of Rare Species) shall follow the BMPs outlined in the Natural Heritage Endangered Species Program (NHESP)-approved National Grid Operation and Maintenance Plan. Work in mapped rare species habitat may require, at a minimum, turtle training for crews and sweeps of work areas for turtles, botanist identification of rare plant locations and avoidance of these locations, and protection of vernal pools, all prior to the start of work. Demarcation of these areas to be avoided (e.g., rare plant populations, overwintering turtles, nests) shall use staked orange snow fencing or an equivalent physical barrier (not just ribbon flagging) and signage. Refer to Section 14.0 for signage guidance.

Where new substations are being constructed or existing substations are undergoing a rebuild or expansion, and the substations are located in mapped rare turtle habitat, project team members should consider fenceline improvements or measures needed to prevent/eliminate turtle entrance into the substation or allow multiple points for easy egress such that turtles are not trapped within the substation fenceline.

Other requirements may apply in NH, VT and RI. Refer to the project-specific EFI for any applicable measures or consult with the National Grid Environmental Scientist.

1.4 Meetings

Pre-permitting meetings shall take place early in the project development process to determine what permits are triggered by the proposed work and the timeline required for permitting. During these meetings, the team shall develop access plans and BMPs to be used during construction of the project.

Field / Constructability review meetings shall take place on-site to evaluate construction site access and job site set-up, to ensure that the project can proceed as permitted. It is at this point in time where work areas, pulling locations, laydown areas, parking areas, and equipment storage areas are evaluated and located. Off-ROW areas under consideration should be included in this discussion.

Prior to submitting permit plans to regulatory authorities, the construction group (contractor or National Grid) shall review the plans for final sign off.

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	5 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England		REFERENCE EP-3; Natural Resource Protection

Pre-construction meetings are typically held prior to the commencement of all work to appoint responsible parties, discuss timing of work, and further consider options to avoid and/or minimize impacts to sensitive areas. These meetings can occur on- or off-site and shall include all the willing and available stakeholders (i.e., utility employees, contractors, consultants, inspectors, and/or monitors, and regulatory personnel). Training of crews and supervisors of the EFI, Stormwater Pollution Prevention Plan (SWPPP), rare species, and other permit requirements shall be conducted at a pre-construction meeting.

Pre-job briefings shall be conducted daily or otherwise routinely scheduled meetings shall be conducted on-site with the work crew throughout the duration of the work. These meetings are a way of keeping everyone up to date, confirming there is consensus on work methods and responsibilities, and ensuring that tasks are being fulfilled with as little impact to the environment as possible.

The Project Environmental Scientist/Monitor and Construction Project Manager shall communicate regularly (e.g. weekly or bi-weekly meetings or phone conversations) to discuss the work completed since last communication (i.e. work locations, wetland impacts, equipment used, and unexpected delays or work conditions). These meetings or calls shall include the expected schedule of construction for the upcoming week, the long term construction plans, and planned methods for working near/in wetlands. Both the Project Environmental Scientist/Monitor and Construction Project Manager shall work together so the Project complies with all environmental permits and regulations. When changes to the Project scope or agreed work plan are proposed they shall be done so with the final approval of the National Grid Environmental Scientist.

1.5 Communication of Project Specific Environmental Requirements

Project specific environmental concerns, to include sensitive resources, permits, approved access and time-of-year or other restrictions, shall be communicated to the project team and be included as part of the Pre-Bid and Pre-Construction Meetings. Project specific requirements shall be communicated to the project manager/construction manager/engineering group using the following guidelines:

Environmental Field Issue – The EFI will be a full document consisting of narrative, project permits, access and matting plans. A table summarizing pertinent (but not all) permit conditions and the responsible party for those conditions shall be included in the EFI. Copies of all permits should be included as attachments. This will be prepared for most projects with multiple permits or large, complex projects (siting board, Section 404, 401 WQC, SWPPP). There shall be EFI training at the pre-construction meeting. The National Grid EFI template is located in **EI-303NE**.

Simplified Environmental Field Issue – The Simplified EFI is a memorandum containing environmental resources present, project permit(s), access and matting plans and a table summarizing relevant permit conditions and responsible party for those conditions. Copies of all permits should be included as attachments. The Simplified EFI will be prepared for most projects with 1 or 2 permits (Order of Conditions, S404 Cat 1). The Simplified EFI should also be provided for projects that have environmental resources present, but the scope of the project does not trigger environmental permitting (e.g., the scope of work qualifies for maintenance exemption(s)). The resources present

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	6 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England		REFERENCE EP-3; Natural Resource Protection

shall be discussed at the Pre-Bid and Pre-Construction meetings and any changes in scope will require additional review by the National Grid project team.

E-mail delivery of Permit and any Sediment/Erosion control or BMP plan – For those projects with only one permit (eg., MA Order of Conditions, RI DEM permit, RI CRMC permit, NH Utility Notification) or projects with a sediment & erosion control plan (local town requirement or for exempt maintenance work), a copy of the permit and any applicable plan will be emailed to the Project Manager (and the project team where deemed necessary) to be incorporated into the Construction Field Issue.

STORMS work management system input – For STORMS work, no EFI is prepared unless multiple permits are required for the project (see guidance above). If only a MA Order of Conditions, MA Determination of Applicability, RI DEM permit, RI CRMC permit, RI SESC Approval, or NH Utility Notification is required, then the permit is attached in the Documents tab and conditions noted in Remarks/Comments section. Standard STORMS boilerplate language is located in **EI-303NE**.

1.6 Timing of Work

Regulatory authorities may place seasonal or time-of-year restrictions on project construction elements. These time-of-year restrictions may be state or permit-specific, and shall be adhered to.

Work during frozen conditions. Activities conducted once wetland areas are frozen sufficient to minimize rutting and other impacts to the surrounding environment may be authorized by the National Grid Environmental Scientist. Work during this time also generally reduces disturbance of aquatic and terrestrial wildlife movement by avoiding sensitive breeding and nesting seasons. When not using mats for access, vehicles shall not be allowed to drive across wetlands without the prior approval of the National Grid Environmental Scientist.

Work during the regulatory low-flow period. Conducting work during the low-flow period can reduce impacts to surface water and generally avoids spawning and breeding seasons of aquatic organisms. If the water is above normal seasonal levels, adjustments to work activities and methods are required.

1.7 Alternate Access

1.7.1 Manual Access

In some cases such as for smaller projects, work areas can be accessed manually. This includes access on foot through upland and shallow wetland areas, access by boat through open water or ponded areas, and climbing of structures where possible. Smaller projects, such as repair of individual structures, or parts of structures, that do not categorically require the use of heavy machinery, shall be accessed manually to the greatest extent practicable.

1.7.2 Use of Overhead/Aerial Access

Using helicopters can be expensive and is not always feasible, but it may be appropriate in some situations in order to get workers and equipment to a site that otherwise may be very difficult to access. The use of overhead and/or aerial equipment may be beneficial for work in areas where larger water bodies, deep crevices, or mountainous areas hinder ground access. The landing area for

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	7 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England		REFERENCE EP-3; Natural Resource Protection

helicopters shall be reviewed for environmentally sensitive resources. Use of helicopters requires Project Manager and Senior Management approval.

2.0 Inspection, Monitoring and Maintenance

All construction practices and controls shall be inspected on a regular basis and in accordance with all applicable permits and local, state, and federal regulations to avoid and correct ANY damage to sensitive areas.

The construction crews shall be responsible for completing daily inspections, and IMMEDIATELY bring any **damage or observed erosion, or failed erosion controls** to the attention of the Person-In-Charge and the National Grid Environmental Scientist. Where applicable and/or as directed by environmental permits issued for the project, the Project Environmental Consultant shall conduct weekly (at a minimum) inspections of the project work areas and shall document their inspection using the Stormwater, Wetlands & Priority Habitat Environmental Compliance Site Inspection / Monitoring Report form found in **Appendix 3** and issue the report within 24 hours. The Person-in-Charge shall work with the National Grid Environmental Scientist and the Project Environmental Consultant to determine when and how the repairs shall be made.

Project-specific Action Logs and Long-Term Restoration Logs are prepared as needed by the National Grid Environmental Scientist or the Project Environmental Consultant to track issues and/or repairs and assign responsible parties.

3.0 Best Management Practices

The BMP sections presented in this EG address access, construction, snow and ice management, structures in wetlands, access road maintenance and repair, clean-up and restoration standards, ROW gates, field refueling and maintenance operations, management of spills/releases, and a summary of key construction BMPs.

Note that BMPs shown on any permit drawings for a specific project may need to be revised and or supplemented during the execution of a project based on unforeseen or unexpected factors such as extreme weather or unknown subsurface conditions. It is the responsibility of the Contractor to work with the National Grid Environmental Scientist and/or the Project Environmental Consultant to identify necessary changes and to ensure that construction-related impacts to wetlands, water bodies and other environmentally sensitive areas are avoided.

Any deviation from the approved BMPs shown in the EFI and/or SWPPP plans shall be communicated immediately to the National Grid Environmental Scientist as it may require additional permitting or could result in a permit violation.

3.1 Wetland Boundary Demarcation

Prior to the start of any activity conducted under an environmental permit, wetland boundaries shall be reviewed. Flagging for wetland boundaries, stream banks and other resource areas shall be

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	8 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England		REFERENCE EP-3; Natural Resource Protection

refreshed as needed. This may become particularly important when the original flagging was placed in previous seasons and now may have become obscured.

3.2 Sedimentation and Erosion Controls

Appropriate sedimentation and erosion control devices shall be installed at work sites, in accordance with permit conditions and/or regulatory approvals, and as needed to prevent adverse impacts to water resources and adjacent properties.

The overall purpose of such controls is to prevent and control the movement of disturbed soil and sediment from work sites to adjacent, undisturbed areas, and particularly to water resources, public roads and adjacent properties. All proprietary controls shall be installed per manufacturer’s recommendations and specifications.

Appropriate sedimentation and erosion control devices include but are not limited to: silt fencing, straw bales, wood chip bags, straw wattles, compost socks, erosion control blankets, mulch, slope interruption practices, flocculent powder/blocks and storm drain/catch basin inlet protection. Such controls shall be installed between the work area and environmentally sensitive areas such as wetlands, streams, drainage courses, roads and adjacent property when work activities shall disturb soils and result in a potential for causing sedimentation and erosion.

In Massachusetts, use of monofilament-encased wattles shall be avoided in mapped Priority Habitat for snakes and amphibians. For projects with work within mapped Priority Habitat for snakes and amphibians, wattles that are encased in a sock, hemp, fiber, or movable jute netting are required to prevent entrapment. Also, “wildlife gaps” should occur every 50 feet, if possible, given wetland permit conditions. This spacing of the wattles allows snakes and amphibians to move across the ROW. Refer to the Amphibian and Reptile BMPs in **Appendix 4**.

Staked straw bales often serve as the demarcation of the limits of work and/or sensitive areas to be avoided. Work shall never be conducted outside the limit of erosion controls without prior approval from the National Grid Environmental Scientist.

Project plans depict proposed erosion controls, however field conditions may warrant additional practices be implemented (e.g., wet conditions, frozen conditions, poorly drained soils, steep slopes, materials used for work pads, transition areas to construction mats, number of trips across work areas, etc.).

Any deviation from the approved erosion controls shown in the EFI and/or SWPPP plans needs to be communicated immediately to the National Grid Environmental Scientist as it may require additional permitting or result in a permit violation.

Appendix 4 provides typical sketches of common sedimentation and erosion controls. If a SWPPP is required for the project, maintenance and inspection of erosion controls shall follow the SWPPP requirements. Sedimentation and erosion controls shall be properly maintained and inspected on a

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	9 of 50
	Date:	08/06/2020
SUBJECT	REFERENCE	
ROW Access, Maintenance and Construction Best Management Practices for New England	EP-3; Natural Resource Protection	

periodic basis, until work sites are properly stabilized and restored. Inspections shall be documented using the Inspection Form “Storm Water, Wetlands & Priority Habitat Environmental Compliance Site Inspection/Monitoring Report” (**Appendix 3**).

The sequence and timing of the installation of sedimentation and erosion control measures is critical to their success. Sedimentation and erosion controls shall be installed prior to commencing construction activities that may result in any soil disturbance or cause otherwise polluted site runoff. Inspection of these devices may be required by the National Grid Environmental Scientist or by regulators prior to the start of work. The installation of water bars and other erosion control measures shall be installed shortly thereafter.

3.3 Concrete Wash Outs

Concrete wash outs shall be used for management of concrete waste. Concrete and concrete washout water shall not be deposited or discharged directly on the ground, in wetlands or waterbodies, or in catch basins or other drainage structures. Where possible, concrete washouts shall be located away from wetlands or other sensitive areas. Consult the National Grid Environmental Scientist on proposed concrete wash out locations prior to their use. Following the completion of concrete pouring operations, the wash outs shall be disposed of off-site with other construction debris. Refer to BMPs in **Appendix 4**.

3.4 Construction Activities in Standing Water

The use of silt curtains or turbidity barriers may be required when working in or adjacent to standing water such as ponds, reservoirs, low flowing rivers/streams, or coastal areas. Silt curtains and turbidity barriers prevent sediment from migrating beyond the immediate work area into the resource areas.

Coffer dams constructed using sheet piling or large sandbags (Trade names such as “the Big Bag” or “DamItDams”) may be used to temporarily isolate and contain a work area in standing water.

When working in standing water, an oil absorbent boom, in addition to a silt curtain or other temporary barrier, shall be placed around the work area for spill prevention.

Work in drinking water reservoirs or other waters may require extensive regulatory agency review, even for maintenance work, which could result in additional time required for permitting, review and material procurement prior to the start of work.

3.5 Dewatering

Where excavations require the need for dewatering of groundwater or accumulated stormwater, the water shall be treated before discharge. Appropriate controls include dewatering basins, flocculent blocks, filter bags, filter socks, or weir tanks. Schematics of these BMPs are included in **Appendix 4**. Water trucks or fractionation tanks may be utilized if watertight containers are desired for controlled on-site discharge or for off-site discharge into an approved dewatering area when site restrictions make it difficult to utilize other dewatering methods on-site. Dewatering discharge water shall never be directed into wetlands, streams/rivers, other sensitive resource areas, catch basins, other

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	10 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England		REFERENCE EP-3; Natural Resource Protection

stormwater devices, or substation Trenwa trenches. Dewatering flow shall be controlled so that it does not cause scouring or erosion through the use of a dewatering basin, filter sock, or equivalent. If it is determined that the chosen controls are not appropriately filtering the fine sediment from the dewatering pumpate then the National Grid Environmental Scientist shall be notified immediately and the controls shall be revised or supplemented.

When establishing a dewatering basin, consideration should be given to the anticipated volume of water and rate of pumping in determining the size of the dewatering basin. Dewatering basins shall be constructed on level ground. Once pumping commences, the basin shall be monitored frequently to assure that the rate of water delivery to the structure is low enough to prevent water from flowing, unfiltered, over the top of the basin walls. The basin shall be monitored throughout the dewatering process because the rate of filtration shall decrease as sediment clogs the filter fabric. If the basin is not appropriately filtering the fine sediment from the dewatering pumpate then the basin may need to be supplemented with a flocculent block. Field conditions shall dictate how often the basin should be inspected.

Distance to sensitive areas, direction of flow (toward or away from protected, or sensitive areas, such as wetlands, ponds, or streams), amount of vegetative ground cover between the basin and nearby sensitive areas, ground conditions (ledge, frozen, etc.), volume of water being pumped, and pump-rate, are some of the factors to be considered when determining an inspection frequency. Clogged filter fabric shall be replaced and accumulated sediment shall be removed as necessary from the basins to maintain efficacy.

Any new dewatering location (not previously reviewed and approved by the National Grid Environmental Scientist during project planning or permitting) shall be reviewed and the discharge location approved by the National Grid Environmental Scientist before use.

Complex projects that require large scale dewatering shall require individual review by the National Grid Environmental Scientist and may trigger additional permitting.

Dewatering in areas of known chemical contamination may require a separate NPDES permit, or other approval, and treatment or containment system. Consult with the National Grid Environmental Scientist.

3.5.1 Overnight Dewatering

Some projects may necessitate 24-hour dewatering for on-site construction activities. Overnight dewatering will be evaluated on a case-by-case basis by the National Grid Environmental Department.

If it is necessary to conduct overnight dewatering on a project, a dewatering plan must be submitted to the Environmental Department for review and approval **5 business days prior to beginning dewatering activities**. Sufficient knowledge of flow, discharge, and re-infiltration rate of water must be obtained and submitted for review. The Environmental Department

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	11 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England		REFERENCE EP-3; Natural Resource Protection

may require monitored dewatering for a period of time in order to provide this data in support of a request for 24-hour dewatering. The dewatering plan must include at a minimum:

1. Location of dewatering system, system components (basin, frac tank, etc), and materials.
2. Location of discharge and distance from closest wetland.
3. Location of erosion controls. A secondary perimeter of erosion controls will be required around the dewatering system for overnight dewatering.
4. Peak flow, discharge rate and re-infiltration rates.
5. Visual monitoring plan for discharge. Expected duration of dewatering.
6. Emergency provisions if overnight, unattended dewatering is proposed.

3.5.2 Dewatering Clean Up/Restoration

Basins shall be cleaned and removed as soon as dewatering is complete. Sediment removed from the dewatering basin shall be allowed to dry before being disposed of by evenly spreading it over unvegetated upland areas where erosion is not a concern if clean or removing it from the site for proper disposal. Off-site trucking of wet soils is prohibited. The sediment disposal area shall be approved by the National Grid Environmental Scientist or the Project Environmental Consultant prior to use. Stabilization measures shall also need to be implemented and approved by the National Grid Environmental Scientist or the Project Environmental Consultant. Soils/sediments shall be dewatered and dried to the point practicable for either on-Site reuse or off-Site transport.

3.6 Check Dams

Check dams are a porous physical barrier installed perpendicular to concentrated storm water flow. They are used to reduce erosion in a swale by reducing runoff energy (velocity), while filtering storm water, thereby aiding in the removal of suspended solids.

Check dams should only be used in small drainage swales that shall not be overtopped by flow once the dams are constructed. These dams should not be placed in streams. Check dams are typically installed in ROWs or on other construction sites prior to the start of soil disturbing work. Per the Rhode Island Soil Erosion and Sediment Control Handbook, no formal design is required for a check dam if the contributing drainage area is 2 acres or less and its intended use is shorter than 6 months; however, the following criteria should be adhered to when specifying check dams.

- The drainage area of the ditch or swale being protected should not exceed 10 acres.
- The maximum height of the check dam should be 2 feet.
- The center of the check dam must be at least 6 inches lower than the outer edges.
- The maximum spacing between the dams should be such that the toe at the upstream dam is at the same elevation as the top of the downstream dam.

Per the NHDES stormwater manual, the use of check dams should be limited to swales with longitudinal slopes that range between 2 to 5 percent that convey drainage from an area less than 1 acre. Existing conditions that exceed these limitations should be assessed in the field and discussed

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 <p style="text-align: center;">National Grid Environmental Guidance</p>	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	12 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England		REFERENCE EP-3; Natural Resource Protection

with the National Grid Environmental Scientist to determine the viability of this BMP for the specific application. Check dams are often comprised of stone, straw bales, sand bags, or compost/silt socks. Use of check dams should be coordinated with the National Grid Environmental Scientist to ensure that the material selection, spacing and construction method are appropriate for the site. Check dams composed of biodegradable materials (e.g. straw bales or wattles, wood chip bags) may require periodic replacement for continued proper functioning¹. Refer to BMPs in **Appendix 4**.

3.7 Water Bars

Water bars should be used on sloping ROWs to divert storm water runoff from unstabilized or active access roads when needed to prevent erosion. Surface disturbance and tire compaction promote gully formation by increasing the concentration and velocity of runoff. Water bars are constructed by forming a ridge or ridge and channel diagonally across the sloping ROW. Each outlet should be stable. The height and side slopes of the ridge and channel are designed to divert water and to allow vehicles to cross. When siting water bars, consideration shall be given to the sensitivity of the area receiving the diverted runoff. For example, runoff should not be directed into a wetland, waterbody, other environmentally sensitive areas, or to private property or public roadways. Refer to BMPs in **Appendix 4**.

3.8 Retaining Walls

In some situations, retaining walls comprised of concrete blocks, gabions, boulders or other comparable materials may be required to stabilize the shoulder of existing access roads and/or supplement required erosion controls. Installation of such measures shall not be allowed as a maintenance activity. Should these controls be considered for a project, it shall be reviewed by the National Grid Environmental Scientist, as design and additional permitting may be required.

3.9 Slope Stabilization

Temporary slope stabilization practices help to keep exposed, erodible soils stabilized while vegetation is becoming established. Acceptable temporary slope stabilization practices may include the use of erosion control blankets, or hydraulic erosion control. Erosion control blankets, often comprised of natural fibers (e.g., jute, straw, coconut, or other degradable materials) are a useful slope stabilization, erosion control and vegetation establishment practice for ditches or steep slopes. Blankets are typically installed after final grading and seeding for temporary or permanent seeding applications. Hydraulic erosion control practices, including Bonded Fiber Matrix or hydroseed with a soil stabilizer (e.g., tackifier and/or mulch) may be an acceptable or desirable alternative form of temporary slope stabilization. For all practices, manufacturer's specifications should be followed for installation depending on slope and other field conditions. Consult the National Grid Environmental Scientist prior to selecting and installing any slope stabilization practices. Refer to BMPs in **Appendix 4**.

¹ Grass growth on a biodegradable type check dam is evidence that the material is decomposing. While this doesn't mean it is no longer functioning, it means it may be in a weakened condition and could potentially fail under high flow velocity. It is acceptable for grass to be growing on a stone check dam.

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	13 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England		REFERENCE EP-3; Natural Resource Protection

3.10 Maintenance of Sedimentation and Erosion Controls

Sedimentation and erosion controls shall be maintained in good operational condition during the course of the work. This includes, but is not limited to, replacing straw bales that are no longer in good condition, re-staking straw bales, replacing or re-staking silt fence, and removing accumulated sediment. Remove sediment before it has accumulated to one half the height of any exposed silt fence fabric, straw bales, other filter berm, check dams or water bars. Accumulated sediment shall be removed from sedimentation basins to maintain their efficacy. Manage the removed sediment by evenly spreading it over unvegetated upland areas where erosion is not a concern, by stockpiling and stabilizing, or by disposing of off-site. Stabilization measures shall also need to be implemented and approved by the National Grid Environmental Scientist or the Project Environmental Consultant. Where a SWPPP has been prepared for a specific site, the guidelines documented therein shall govern the management of sediment.

4.0 Right-of-Way (ROW) Access

Whenever possible, access shall be gained along existing access routes or roads within the ROW. However, in some cases there is no existing access. In many cases, temporary access can be utilized. The following practices provide general guidance on accessing a ROW. Check with a National Grid Environmental Scientist to determine if any environmental permitting is required before utilizing a temporary access.

Note that the building of new roads or enlargement of existing roads is **prohibited** unless this activity is allowed by a project-specific permit, and the new roads appear on the Site Plans that were authorized in the regulatory approvals.

4.1 Off-ROW Access

Off-ROW access shall be evaluated for wetlands, rare species, cultural resources and other potential sensitive receptors, as applicable. National Grid Real Estate and Stakeholder Relations shall also be contacted as soon as possible once off-ROW access is determined to be needed.

4.2 Stabilized Construction Entrance/Exit for Access to ROWs from Public or Private Roads

A suitable (minimum 15-foot wide by 50-foot long) construction entrance/exit shall be installed at the intersection of the ROW access road/route with public/private paved roads, or other such locations where equipment could track mud or soil onto paved roads. The construction entrance/exit should be comprised of clean stone installed over a geotextile fabric. Geotextile fabric may be omitted for permanent construction entrances/exits on a case-by-case basis with the approval of the National Grid Environmental Scientist. Refer to BMPs in **Appendix 4**.

Construction entrance areas shall be monitored and maintained to ensure that stone or other material is not deposited onto the roadway, causing a safety concern. Where track-out of sediment has occurred onto a roadway, it shall be swept off the road by the end of that same work day.

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	14 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England	REFERENCE EP-3; Natural Resource Protection	

If a construction entrance/exit is clogged with sediment and no longer functions, the sediment and stone may require removal and replacement with additional clean stone (clean stone refreshment) to ensure this tracking pad is performing its intended function adequately. Heavier traffic use may require this clean stone refreshment multiple times throughout a project. Reinforcement of these stabilized construction entrance/exits with asphalt binder or asphalt millings is not likely to be considered “maintenance” and may trigger additional permitting requirements². In some cases, heavily used construction entrances/exits may benefit from the installation of a 5-15 foot strip of asphalt binder or asphalt millings closest to the paved roadway to capture any stone that is tracked from the stone apron. Such cases shall be evaluated on an individual basis with the National Grid Environmental Scientist.

Once work is complete, the construction entrance/exit shall either be removed or retained, depending upon future maintenance-related access needs, property ownership, and/or project-specific approvals. If removed, the area shall be graded, seeded (if adequate root and seed stock are absent) and mulched. Proper approvals for leaving access roads in place shall be obtained; contact the National Grid Environmental Scientist and Property Legal.

4.3 Maintenance of Existing Access Roads

In many cases, the existing access road may need to be maintained to allow passage of the heavy equipment required for scheduled maintenance work. Access roads cannot deviate from the approved and permitted access plans. Maintenance of these roads may include adding clean gravel or clean crushed stone to fill depressions and eroded areas. This activity shall be conducted only within the width of the existing access road footprint and does not include widening existing access roads

If gravel begins to migrate onto the existing vegetated road shoulder, this gravel shall be removed during the project and/or after the completion of use of the road to ensure the road fill is not spreading into adjacent resource areas, or resulting in the road becoming much wider than its pre-existing or permitted condition. In some areas of mapped rare species habitat or other sensitive areas where project-specific permit conditions require the prevention of the migration of sediments into adjacent resources, an engineered stabilization system (e.g., GeoWeb or similar) may be suitable to prevent sedimentation while allowing for unrestricted wildlife migration.

In Massachusetts, any proposed widening of access roads in turtle Priority Habitat would require individual consultation with NHESP and, depending on the level of impact proposed, may require a Project Review filing. The limited filling of ruts or potholes is compatible with the National Grid Operation and Maintenance Plan approved by NHESP under the Massachusetts Endangered Species Act, however, severely rutted access roads in turtle Priority Habitat that require extensive linear feet of stone for safe passage will require individual consultation with NHESP.

² Depending on the road, use of an asphalt binder or asphalt millings as a construction entrance/exit may trigger state or local permit requirements.

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	15 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England		REFERENCE EP-3; Natural Resource Protection

Major reconstruction projects may require multiple permits. In all cases, the fill to be used for existing access roads shall be clean and free of construction debris, trash or woody debris. Use of processed gravel may be approved by the Person-In-Charge and the National Grid Environmental Scientist, on a case-by-case basis. If clean stone is used then addition of more erosion controls may not be necessary.

4.5 Maintenance of Existing Culverts

Damaged culverts may not be repaired or replaced without consulting with the National Grid Environmental Scientist to determine if a permit is required. For functioning culverts, care shall be taken to protect adjacent wetlands and watercourses by installing appropriate sedimentation and erosion controls around the downstream end of the culvert. Culverts shall be repaired/replaced in kind and shall not be changed in size unless approval has been obtained from the National Grid Environmental Scientist. In-kind replacement is replacement using the same material, functional inverts, diameter and length as the existing culvert. Changes to any of these characteristics shall require permitting. Installation of any **new** culvert is not allowed without obtaining all necessary permits first. Refer to BMPs in **Appendix 4**.

If, at the time of anticipated replacement, there is heavy flow through the culvert, the Person-In-Charge shall consult with the National Grid Environmental Scientist, to verify whether the culvert shall be replaced at that time. Water may need to be temporarily diverted during culvert repair/replacement. There typically are seasonal restrictions limiting both the replacement of existing culverts as well as installation of new culverts to the low-flow period. The low-flow period can vary from state to state. If any unexpected conditions are encountered during culvert replacement, the National Grid Environmental Scientist shall be contacted immediately prior to the work being completed for additional consultation.

4.6 Temporary Construction Access over Drainage Ditch or Swale

In some situations, construction access from paved roads onto ROWs may require the crossing of drainage ditches or swales along the road shoulder. In these situations, the installation of construction mats, mat bridges or temporary culverts may facilitate construction access over the ditches or swales. These culverts shall be temporary only, sized for peak flow, and shall be removed after construction is complete. Consult with the National Grid Environmental Scientist prior to installation. In addition, if access over existing culverts may require extending the culvert, consult with the National Grid Environmental Scientist. Refer to BMPs in **Appendix 4**.

4.7 Construction Material along ROW

After preparing a site by clearing and/or installing any necessary erosion and sediment controls and prior to the start of construction, material such as poles, cross-arms, cable, insulators, stone and other engineered backfill materials may be placed along the ROW, as part of the project. The stockpiling of stone and other unconsolidated material on construction mats shall be avoided, if determined necessary due to access and work pad constraints, the material must be placed on a geotextile fabric and be properly contained with a sedimentation barrier such as straw wattle. No construction material shall be placed in wetlands or other sensitive resource areas unless authorized by the National Grid Environmental Scientist or Project Environmental Consultant.

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	16 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England		REFERENCE EP-3; Natural Resource Protection

5.0 Winter Conditions

5.1 Snow Management

Refer to **Appendix 6** for the current Snow Disposal Guidelines.

5.2 De-Icing

Where allowed, calcium chloride is preferred as a de-icing agent when applied according to manufacturer's guidelines in upland areas. Sand shall be used on construction mats through wetland areas.

Consult with the National Grid Environmental Scientist on de-icing agents when working in a facility or substation close to resource areas. Many municipalities have specific requirements for de-icing agents allowed within 100 feet of wetland resources and other sensitive areas.

5.3 Snow and Ice Management on Construction Mats

Proper snow removal on construction mats shall avoid the formation of ice. To avoid the formation of ice, snow shall be removed from construction mats before applying sand. Prior to their removal from wetlands, sand shall be collected from the construction mats and disposed of in an upland area. A round street sweeping brush mounted on the front of a truck may be an effective way to remove snow from construction mats. Propane heaters may also be suitable solutions for snow removal and/or de-icing of construction mats.

Once construction mats are removed, wetlands shall be inspected for build up of sand that may have fallen through construction mats. Care shall be taken to inspect wetland crossings as each mat is removed to ensure sand is properly removed and disposed of off-site.

6.0 Construction Mats

The use of construction mats allows for heavy equipment access within wetland areas. The use of construction mats minimizes the need to remove vegetation beneath the access way and helps to reduce the degree of soil disturbance and rutting in soft wetland soils. Construction mats most often used by National Grid are wooden timbers bolted together typically into 4-ft by 16-ft sections, wooden lattice mats, or composite mats. In some cases, construction mats or other mats are used for staging or access in upland areas based on site conditions (e.g., agricultural field access). Refer to BMPs in **Appendix 4**.

Typically construction mats may be installed on top of the existing vegetation, however in some instances cutting large woody vegetation may be required. Check with National Grid Environmental Scientist prior to cutting or clearing vegetation for construction mat placement.

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	17 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England	REFERENCE EP-3; Natural Resource Protection	

Where an extended period of time has lapsed since wetland delineation and start of construction, and new vegetative growth has concealed wetland flagging or flagging is simply no longer obviously visible, wetland boundaries should be re-flagged where necessary prior to the installation of matting.

Follow the approved plans in the EFI for construction mat installation and do not deviate from the plans. **Any deviation from the approved plans needs to be communicated immediately to the National Grid Environmental Scientist as it may require additional permitting, require stopping the project or result in a permit violation or revocation.**

6.1 Construction Mats and Mowing

Close coordination with the mowing contractor shall be required to ensure that access plans are followed, and construction mats are utilized when necessary. Sometimes mowing contractors may have to work off the leading edge of a construction mat to mow in order to lay the next construction mat and continue further into the wetland. Under no circumstances shall trees or shrubs be allowed to be pulled out of the wetland by the root ball. The root ball of trees and shrubs shall remain intact. Chipping debris and excessive amounts of slash shall not be placed in wetlands or other resource areas. In some instances, it may be beneficial to pile a reasonable amount of slash within a nearby upland area to create habitat for wildlife. This activity shall be approved by the National Grid Environmental Scientist.

6.2 Stream Crossings and Stream Bank Stabilization

Stream crossings shall be bridged with construction mats or other temporary minimally-intrusive measures unless fording is acceptable for the site and is authorized by the National Grid Environmental Scientist. Care shall be taken when installing a construction mat bridge to insure that the stream bed and banks are not damaged during installation and removal and that stream flow is not unduly restricted. Where stream width allows, construction mats shall be installed to span the watercourse in its entirety without stringer placement in the water or any restriction of stream flow. Environmental permits may be required to cross or disturb protected waters, depending upon state-specific regulatory requirements. Refer to BMPs in **Appendix 4**. Immediately following construction mat removal, all stream banks shall be stabilized and restored to prevent sedimentation and erosion.

6.3 Cleaning of Construction Mats

Mats shall be certified clean by the vendor prior to installation. The vendor shall use the certification form provided as **Appendix 5** to document compliance. Clean is defined as being free of plant matter (stems, flowers, roots, etc), soil, or other deleterious materials prior to being brought to the project site. Any equipment or timber mats that have been placed or used within areas containing invasive species within the project site shall be cleaned of plant matter (stems, flowers, roots, etc), soil, or other deleterious materials at the site of the invasive species prior to being moved to other areas on the project site to prevent the spread of invasive species from one area to another³. **Mats shall be cleaned prior to being removed at the completion of the project: exceptions to this requirement**

³ On ROW projects where multiple wetlands may be dominated by the same invasive species, cleaning may not be required for movement along the ROW. Check with the National Grid Environmental scientist for guidance.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	18 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England		REFERENCE EP-3; Natural Resource Protection

may be made on a case-by-case basis. Consult with the National Grid Environmental Scientist prior to discharging or disposing of any waste water or waste material from the cleaning of construction mats.

6.4 Stone Removal for Construction Mat Placement

For situations where the matting contractor determines that stones or boulders must be removed or relocated within wetland areas in order to install safe and level structure work pads or access roads the boulders shall be moved in a manner which does not result in significant soil disturbance (i.e., pushing with a bull dozer is not allowed). The boulders shall not be placed on any existing vegetated areas within wetlands or within vernal pools. When numerous boulders shall be removed from a wetland area, they shall be deposited in an upland area outside of the flagged wetland limits, outside of any cultural resource areas and outside of any RTE species populations. Any boulders that shall be placed within buffers (In MA, the 100-foot buffer zone, and in RI, the 50-foot Perimeter Wetland, 100-foot or 200-foot Riverbank Wetlands) shall be placed to avoid causing soil disturbance and they shall be within an approved limit of work. When there is a significant number of boulders that need to be removed, the National Grid Environmental Scientist shall be consulted for guidance.

6.5 Transition onto Mats

Erosion controls and stone or wood chip ramps shall be installed to promote a smooth transition to and minimize sediment tracking onto construction mats. Geotextile may be added beneath stone or wood chip transitions to facilitate removal, as necessitated by site or permit conditions. Mat transitions shall be removed once construction mats have been removed and during restoration. Refer to BMPs in **Appendix 4**.

6.6 Construction Material on Mats

The stockpiling of stone, drill spoils and other unconsolidated material on construction mats shall be avoided unless determined necessary due to access and work pad constraints. Additional controls, such as watertight mud boxes and geotextile/filter fabric over or between construction mats shall be considered for stockpile management. If material is placed on construction mats and falls through into wetlands, the material must be removed by hand. Saturated soils shall be allowed to dewater prior to off-site transport for sufficient time to ensure that water/sediment is not deposited onto construction mats or public roads during transport. Heavy machinery shall not be left overnight on mats located within floodplain unless approved by the National Grid Environmental Scientist, the machinery is still in use, and removal of the equipment requires the use of additional equipment to move it and would increase vehicle trips in/ou of wetlands. In these situations and when approved by the National Grid Environmental Scientist, the equipment shall be secured against vandalism and secondary containment measures shall be employed where feasible. Mat anchoring shall be evaluated, see below.

6.7 Mat Anchoring

The National Grid Environmental Scientist and Project environmental consultant shall indicate to the project team when mat anchoring may or shall be necessary. The matting contractor will propose the method of mat anchoring, which will be approved by the National Grid Environmental Scientist and the

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	19 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England		REFERENCE EP-3; Natural Resource Protection

National Grid Construction Supervisor. The need for anchoring should be noted in the project EFI, on the project access and matting plans, and in the scope of the bid document (if externally sourced).

Anchoring of construction mats should be considered when any of the following conditions are presented at a project work location:

Location	Considerations
Stream crossings Shorelines of Ponds/Lakes Wetlands Floodplains	When located in a mapped flood area (A). When mapped 100-year flood elevations (AE) are greater than 2 ft above existing grades. Where past flash flood events have occurred. Where steep terrain is present or surrounds the project location. When mats will be in place during hurricane season for greater than 2 weeks.
Tidal areas	When located in a Velocity (V or VE) Zone. When mats will be in place during a moon tide cycle. When mats will be in place during hurricane season for greater than 2 weeks.

Examples of mat anchoring are provided below, but the implementation methods for anchoring mats are not limited to these examples. Where anchoring is determined to be necessary, the matting contractor should propose a method suitable based on field conditions and that takes crew safety, slip/trip/fall hazards, size of matting footprint, and other project and site-specific factors into consideration. Refer to BMPs in **Appendix 4**.

Limited sets of mats

- Cable or rope in chain pockets and run linearly, or
- Linear ropes anchored using helical screws, manta ray anchors, or posts.

Larger sets of mats or those without chain pockets

- Chain link fence posts or other posts driven in along mat edge every 3-4 feet and ropes then laced across mats between opposing posts before storm event, or
- Anchor bolts added to mats, then cable is laced between bolts and tied to helical or manta ray anchor.

6.8 Corduroy Roads

Corduroy roads are a wetland crossing method where logs are cut from the immediate area and used as a road bed to prevent rutting from equipment crossing. This technique is designed to be used in areas of wetland crossings where there is no defined channel or stream flow and should never be used in streams. Corduroy logs shall be placed in the narrowest area practicable for crossing with the logs

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE

	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England		REFERENCE EP-3; Natural Resource Protection

placed perpendicular to the direction of travel across wet area. The use of corduroy logs shall only be in emergencies when approved by the National Grid Environmental Scientist or when they have been specifically permitted as part of a project. Refer to BMPs in **Appendix 4**.

6.9 Construction Mat Removal

Once construction mats are removed, wetlands shall be inspected for build up of sand or other materials that may have fallen through construction mats. Care shall be taken to inspect wetland crossings as each mat is removed to ensure any materials are properly removed and disposed of off-site.

6.10 Utility Air Bridging

In ROWs where other utility facilities (including but not limited to gas, oil, fiber optic, electric, water, and sewer) are co-located within the transmission ROW, bridging may be required to cross those facilities. The project team shall coordinate with the respective utility company prior to determining if bridging or permanent crossings are required.

7.0 LGP Equipment Use

Only when approved by the National Grid Environmental Scientist on a case-by-case basis shall equipment with a LGP **psi that meets the state-specific USACE General Permit requirement when loaded** be allowed to access through wetlands. Refer to the state-specific General Permit for the definition of LGP in each state at: <http://www.nae.usace.army.mil/Missions/Regulatory/State-General-Permits/>, or to the summary table provided below. The National Grid Environmental Scientist's approval of the use of LGP equipment through wetlands depends on several criteria including:

- Time of year. LGP equipment use may be allowed if weather and field conditions at the time of construction are suitable to eliminate/minimize the concern of rutting or other impacts. Frozen, frozen snow pack, low flow, drought conditions, or unsaturated surface soil conditions are typically acceptable conditions. Spring and fall construction, due to the typical higher precipitation, are not suitable times of year for LGP equipment use.
- Number of trips. Multiple trips through a wetland have shown to increase the potential for damage and require matting. LGP equipment use shall likely only be approved if trips are limited to one trip in and one trip out.
- Type of wetland system. Some wetlands have harder soils/substrate, and may be passable without causing significant damage. Some of the wetlands along National Grid ROWs have existing hard bottom roads that have been vegetated over time and may be traversed with LGP equipment without construction mats.
- Emergencies. LGP equipment use may be allowed during emergency or storm conditions for outage restoration.
- State-specific USACE General Permit Performance Standards. The standard is for no impact to the wetland, which may be obtained by using LGP equipment **when loaded**). *"Where construction requires heavy equipment operation in wetlands, the equipment shall either have low ground*

Approved for use per EP – 10, Document Control.

SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England	REFERENCE EP-3; Natural Resource Protection	

pressure (as specified in the USACE GP), or shall not be located directly on wetland soils and vegetation; it shall be placed on construction mats that are adequate to support the equipment in such a way as to minimize disturbance of wetland soil and vegetation.”

- Local bylaws. Municipal wetland bylaws, where applicable, shall be reviewed for prohibitive conditions or applicable performance standards.

LGP equipment is prohibited in the following resources areas:

- Stream crossings
- State listed-species habitat
- Outstanding Resource Waters (ORWs)
- Vernal pools
- Archaeological sensitive areas

Where LGP equipment use is desired in lieu of construction mats, the construction supervisor should identify these areas on marked-up access plans. A site visit with the Project Environmental Monitor should be scheduled to assess if the proposed locations are potential candidates. The Project Environmental Monitor will document potentially suitable locations and dismiss others as unsuitable.

Approved for use per EP – 10, Document Control.

State	Restrictions	Maximum PSI (when loaded) for Use without Mats	Reference
	Note: Written authorization from the Corps required to waive the use of mats during frozen or dry conditions.		

Due to the fact that ground conditions may change between the time of the evaluation and construction, LGP equipment approval is required **at the time of construction for each wetland crossing** and shall be dependent upon the above conditions. In addition, LGP equipment use and approval shall be assessed by the National Grid Environmental Scientist or Project Environmental Monitor during construction on a continuing basis

Once a location is approved for the use of LGP equipment:

- The Construction Supervisor must check-in with the Project Environmental Monitor at least two weeks before construction begins to ensure conditions remain suitable for LGP equipment use, and weather conditions are favorable.
- The Project Environmental Monitor must observe the equipment when in use.
- LGP equipment use shall cease immediately if field conditions are found to be unsuitable (i.e. soil rutting greater than six inches or the destruction of vegetation root systems beyond the capacity of natural revegetation).
- **If wetlands damage occurs, the use of the LGP equipment shall be suspended, and the wetlands be restored.**
- Any LGP equipment used within areas containing invasive species within the project site shall be cleaned of plant matter (stems, flowers, roots, etc), soil, or other deleterious materials at the site of the invasive species prior to being moved to other areas on the project site to prevent the spread of invasive species from one area to another.

8.0 Soil Disturbing Activities

8.1 Dust Control

Cutting activities shall be conducted to minimize the impacts of dust on the surrounding areas. Dust suppression is an important consideration. Water or other National Grid approved equivalent in accordance with the manufacturer's guidelines may be used for dust control along ROWs in upland areas. During application of water for dust control, care shall be taken to ensure that water does not create run-off or erosion issues. Refer to BMPs in **Appendix 4**.

8.2 Clearing

Clearing is not allowed without specific permission as it constitutes soil disturbance under several regulatory programs and may trigger permitting by increasing the project's footprint of disturbance. If clearing is required for a project, the limit of clearing shall be established with flagging or construction

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	24 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England		REFERENCE EP-3; Natural Resource Protection

fencing and/or erosion controls. Clearing shall be done in accordance with project specific permits. Following the completion of clearing, the limits of work shall be re-established. Refer to BMPs in **Appendix 4**.

8.3 Grubbing

Grubbing is not allowed without specific permission as it constitutes soil disturbance under several regulatory programs and likely triggers permitting by increasing the project’s footprint of disturbance. If grubbing is required for a project, the limit of grubbing shall be re-established after clearing has been completed. The area of grubbing shall be identified with flagging or construction fencing and/or erosion controls. Grubbing shall be conducted in accordance with project-specific permits.

8.4 Blasting, Noise and Vibration Control

If blasting is anticipated, the project team, including the National Grid Environmental Scientist, shall be consulted. If possible, plan work in residential areas to avoid noisy activities at night, weekends or during evenings. Emergency work in residential areas should be carried out in such a way as to keep noise to a minimum at night and weekends. Equipment should be maintained as per the manufacturer’s guidance to minimize noise and vibration.

Work plans must consider local noise ordinances and provide specific controls to ensure noise levels are maintained within specified limitations.

8.5 Site Grading

The work site shall not be graded other than in accordance with project permits. Any proposed grading shall be reviewed by the National Grid Environmental Scientist for wetlands, rare species habitat, areas of cultural and historical significance, and other environmentally sensitive areas prior to start of work. In some cases, additional testing for cultural or historical resources may be triggered by proposed grading; alternatives to grading may be sought due to protracted time frame of obtaining the permit associated with testing and performing the testing. Grading outside of a regulated area shall be kept to the minimum extent necessary for safe and efficient operations and shall comply with the project permit plans.

Grading shall be performed in a manner which does not increase the erosion potential at the Site (e.g., terraces or slope interruptions shall be utilized). Graded sites shall be promptly stabilized by applying a National Grid approved seed mix (if adequate root and seed stock are absent), and mulching with hay, straw or cellulose (use straw or cellulose hydromulch where the potential introduction of invasive plant species is of concern) to reduce erosion and visual impact, as soon as possible following completion of work at the site. Grading within a regulated area shall be subject to the review and approval of the National Grid Environmental Scientist.

In some municipalities, site grading activities require the prior approval of the Town Engineer, Building and Zoning Official, or Public Works Director. Local ordinances or bylaws should be reviewed for applicable restrictions and permitting thresholds

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE

	Page No.:	25 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England		REFERENCE EP-3; Natural Resource Protection

8.6 Grounding Wells

The installation of grounding wells shall require erosion controls and proper soil management. Due to the typical depth required for grounding wells (typically 50 to 200 feet or more), erosion controls shall be installed around the proposed well location when working in buffer zone, in proximity to sensitive resources or near slopes. Also, dewatering basins may be required for the proper management of groundwater. The National Grid Environmental Scientist shall be consulted for the disposal of any excess soil.

8.7 Counterpoise and Cathodic Protection

The installation of counterpoise or cathodic protection shall require erosion controls and proper soil management. The National Grid Environmental Scientist shall be consulted for the disposal of any excess soil.

8.8 Work Pads

When work pads are being constructed, only clean material shall be used in their construction. Work pads shall only be constructed in areas approved by the National Grid Environmental Scientist and shown on the approved permit access plans.

8.9 Site Staging and Parking

During the project planning and permitting process, locations shall be identified for designated crew parking areas, material storage, and staging areas. Where possible, these areas should be located outside of buffer zones, watershed protection areas, and other environmentally sensitive areas. Any proposed locations shall be evaluated for all sensitive receptors and for new projects requiring permitting, shall be incorporated onto permitting and access plans.

8.10 Soil Stockpiling

Soil stockpiles shall be located in upland areas and, if in close proximity to wetlands and wetland buffers, shall be enclosed by staked straw bales or another erosion control barrier. The stockpiling of stone, drill spoils and other unconsolidated material on construction mats shall be avoided unless determined necessary due to access and work pad constraints. Additional controls, such as watertight mud boxes and geotextile/filter fabric over or between construction mats shall be considered for stockpile management. If material is placed on construction mats and falls through into wetlands, the material must be removed by hand. Saturated soils shall be allowed to dewater prior to off-site transport for sufficient time to ensure that water/sediment is not deposited onto construction mats or public roads during transport.

8.11 Top Soil/High Organic Content Soil

When the work site requires excavation and grading, the top soil shall be stockpiled separately from the material excavated. This top soil shall be spread as a top dressing over the disturbed area during restoration of the site.

In some instances where work is occurring within wetlands, high organic content soil may be displaced. Such high organic content soil shall be segregated from other excavated materials and stockpiled for

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	26 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England	REFERENCE EP-3; Natural Resource Protection	

use in wetland restoration areas. Care shall be taken to minimize the handling of high organic content soil. Preferably, the soil shall be stockpiled in one location until it is moved to the restoration area.

9.0 Stone Wall Dismantling and Re-building

Removal or alteration of stonewalls shall be avoided, whenever possible. As appropriate, some stonewalls removed or breached by construction activities shall be repaired or rebuilt. Rebuilt stone walls shall be placed on the same alignment that existed prior to temporary removal, to the extent that it shall not interfere with operations. The removal and rebuilding of stone walls requires approval from the National Grid Environmental Scientist and Property Legal, and may require several weeks lead time for coordination. Note that not all states allow this technique and that dismantling may not be allowed at all due to quality or significance of the wall. Once a stone wall has been identified as requiring dismantling, the following procedures shall be followed:

- Identify stone wall that is required to be temporarily dismantled and notify project team that a site visit is warranted to review the stone wall.
- The National Grid Environmental Scientist, with support from Property Legal and/or cultural/historical consultant, shall determine if permitting or additional permissions are required prior to dismantling stone wall.
- Once permit or permissions have been received, full documentation of wall dimensions (measurements and photographs) shall be submitted to the National Grid Environmental Scientist. Documentation of the wall dimensions shall be marked onto a copy of the applicable EFI access plan (or equivalent plan) with a useful reference for future locating such as GPS coordinates and/or measurement from a permanent reference point (closest structure location or closest cross street, etc.). The wall shall be photographed from all sides with a written description of the photograph (i.e. southern side of wall looking north). In addition, documentation of the length of wall to be dismantled shall be recorded. Take special care to note if granite property bounds (or other marker) are located within the wall so additional survey can be accomplished prior to dismantling in cases where the stone wall represents a property boundary. Site visits by project team (which shall include the National Grid Environmental Scientist) are a mandatory requirement prior to dismantling.
- No dismantling shall take place until documentation has been submitted to the National Grid Environmental Scientist and approved as sufficient documentation.
- Stones from the wall shall be removed from the work area and temporarily stored in nearby location, away from wetlands; buffer zones; rare species habitat and other historical/archeological concerns.
- Avoid dismantling via the “bulldozer” method when possible as this method makes it nearly impossible to rebuild the wall in the same alignment due to its uncontrolled nature. Dismantling shall be conducted either by hand, with stones stacked as they are removed, or on less “sensitive” walls to use an excavator with a thumb to grab each stone and build a stockpile. Significant ground disturbance below the wall shall be avoided.

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	27 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England		REFERENCE EP-3; Natural Resource Protection

- Once construction and access in the area has been completed, the wall shall be rebuilt to pre-dismantled conditions or better. If rebuilding a stone wall can not be placed on the same alignment that existed prior to temporary removal, approval from the National Grid Environmental Scientist and Property Legal is required. **Note that if the wall represents a legal property boundary or is historically or culturally significant (or was previously determined to be in a very high quality condition), a professional stone masonry company may be required to document wall alignment, and conduct the dismantling and rebuilding.**

10.0 Avian Nest Removal

Avian nest removal shall be done in accordance with EG-304. Consult the National Grid Environmental Scientist prior to removing any nests. There are seasonal restrictions of the removal of avian nests and federal or state permits may be necessary prior to removal.

11.0 Drilling Fluids and Additives

When installing subsurface structures, there may be a need to utilize drilling aids such as slurries, borehole sealants, and other additives. All necessary steps shall be taken by National Grid personnel and contractors to prevent potential adverse effects on drinking water aquifers, groundwater quality, and wetlands when utilizing drilling aids. Efforts should be made to utilize natural bentonite clay-type materials, in place of polymer-based drilling aids. Regardless of the specific product type, the following requirements shall be met:

- Drilling aids must be NSF certified and manufactured to NSF-ANSI 60 standards. https://www.nsf.org/newsroom_pdf/NSF-ANSI_60_watemarked.pdf
- Product use must be in accordance with manufacturer's specifications and instructions.
- National Grid personnel or their contractor shall provide all the necessary information regarding the proposed product to be used to National Grid's Environmental Sustainability, Compliance and Licensing & Permitting Department as early as possible in the project planning phase. If the work is being performed by a contractor, this information must be included as part of their initial bid package.
- If polymer-based products are proposed for use, product information shall be included in all related environmental regulatory filings and frac-out plans, if possible.
- A qualified individual shall be designated who will confirm/verify and document the specific use of a drilling aid at each location. This will include add-mix ratios, surface area treated, volume of water within excavation, volumes/weight of additives used, and any other measurements specified by the manufacturer. No mixing will be allowed in the drilled shaft excavation.
- The Contractor or National Grid crew performing the work is responsible for neutralizing all drilling products, as applicable, in accordance with the manufacturer's specifications. This shall be performed following removal from the excavation and while held in holding tanks. A

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	28 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England		REFERENCE EP-3; Natural Resource Protection

qualified person shall be designated by the Contractor who will confirm/verify and document the appropriate neutralization activity at each location, as necessary.

- Waste drilling aids (neutralized or not) or soils that may have come into contact with drilling aids will not be disposed of on National Grid properties, discharged to any ground surface or subsurface, waterbodies, wetlands or placed on 3rd party properties.
- All product use must be completed in strict adherence with the management, storage, mixing, transporting, disposing and any other requirements of state and federal regulatory approvals and permits, as applicable.
- Relevant documentation shall be maintained by the Contractor or National Grid crew performing the work, and shall include volume of material treated and disposed and the location/facility at which it was disposed.
- National Grid will not be identified as the disposal generator for any polymer based slurry waste or additives generated by Contractor activities.
- The Contractor or National Grid crew performing the work assumes full responsibility for the safe storage of all polymers and additives during use and also assumes full responsibility for improper use and application of said polymers and additives that are deemed to have contravened aquifer and/or groundwater quality.
- National Grid reserves the right to refuse and terminate the use of any specific drilling aid at any time.

Regardless of the type of drilling aid utilized, the Contractor or National Grid crew performing the work is responsible for properly treating, containerizing, testing, transporting and disposing of any/all fluids and solids generated during their activities. All wastes must be disposed of in accordance with federal and state regulations. Relevant documentation shall be maintained and shall include volume of material treated and disposed and the location/facility at which it was disposed.

12.0 Water Withdrawal for Geotechnical Investigations

The use of water during geotechnical drilling operations may be required, and is most common during the “drive and wash” drilling technique, where 4- or 6-inch diameter casing is driven into the ground, and the soil inside the casing is washed out using a pump and hollow rods. Soil samples are generally collected at periodic intervals using a split spoon sampler (e.g., every 5 vertical feet).

The National Grid Environmental Scientist and/or Project Environmental Monitor may approve withdrawals from wetlands and waterways on a case-by-case basis should the geotechnical team advise no other options are available. Generally, the amount of water required for withdrawal is between 100 and 200 gallons, and the water is then recycled continuously in the drilling process. Certain scenarios may require additional water usage if water is lost down the boring (e.g., lost due to bedrock fractures during rock coring). The following general guidance should be adhered to when determining whether water withdrawals may be allowed during geotechnical investigations on the ROW. Approval from the National Grid Environmental Scientist and/or Project Environmental Monitor is required prior to initiating water withdrawals during geotechnical investigations.

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	29 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England		REFERENCE EP-3; Natural Resource Protection

- Withdrawals from perennial streams, ponds, lakes and large wetlands systems are preferred over small isolated wetlands to ensure the water level, water table, and hydroperiod are not affected. Prior to start of work, the Contractor shall identify which water source they prefer to withdraw from. The National Grid Environmental Scientist and/or the Project Environmental Monitor will confirm whether these sources are appropriate.
- Care should be taken to avoid alteration of wetlands or the beds and banks of surface waters. Examples of alterations include, but are not limited to, the following:
 - (a) the changing of pre-existing drainage characteristics, flushing characteristics, salinity distribution, sedimentation patterns, flow patterns and flood retention areas;
 - (b) the lowering of the water level or water table;
 - (c) the destruction of vegetation; and
 - (d) the changing of water temperature, biochemical oxygen demand (BOD), and other physical, biological or chemical characteristics of receiving waters.
- Wetlands and waterways providing habitat for rare species should be avoided unless all other options are exhausted. Under no circumstances should water be withdrawn from a Vernal Pool.
- Withdrawal pipes or stingers should be elevated off the bottom of wetlands and streams during the duration of pumping. Additionally, fabric or screening should be covering the withdrawal pipes to eliminate inadvertent harm to wildlife.
- Withdrawals should be performed in a manner that does not damage vegetation, disturb sediment, or result in the release of temporary or permanent fill material (e.g., sediment, spoils, or turbid water) into the wetland/waterway. Additional detail from geotechnical experts may be required to solidify BMP recommendations.
- Any water used for geotechnical drilling operations (including water withdrawn from surface water, brought on-site, or from other sources) shall be discharged into the open borehole or to an upland area such that the water infiltrates to the ground and is not discharged to a wetland or surface water resource area. Consultation with the National Grid Environmental Scientist and/or the Project Environmental Monitor is required if this is not feasible. At no time should water withdrawals result in a temporary or permanent fill/discharge of material (e.g. sediment, spoils, or turbid water) into the wetland or waterway.
- If water sourcing options is not determined prior to mobilization, necessary water shall be brought in by tank truck. Should withdrawal from surface water sources become necessary during soil boring work, the National Grid Environmental Scientist and/or the Project Environmental Monitor shall be notified prior to beginning withdrawal. If initial withdrawal from surface water is approved by the National Grid Environmental Scientist and/or the Project Environmental Monitor, the driller may withdraw from the surface water, as long as the above criteria are met.
- If excessive water withdrawal is necessary, the National Grid Environmental Scientist and/or the Project Environmental Monitor shall be consulted to determine whether the water source is appropriate for withdrawal.
- In New Hampshire, withdrawals made from state-owned property require written permission from

Approved for use per EP – 10, Document Control.

SUBJECT	REFERENCE	
ROW Access, Maintenance and Construction Best Management Practices for New England	EP-3; Natural Resource Protection	

the agency with primary responsibility for monitoring and/or maintaining the site.

13.0 Gates

When not in use, gates shall be locked with a company-approved lock or double locked with the property owner's lock. New gates may be installed during a project, however, installation of a gate requires permission from the property owner, and may require environmental permitting. Consult with National Grid Real Estate and the National Grid Environmental Scientist prior to installing a new gate, as well as with the appropriate engineering department for the current company gate specifications. Refer to BMPs in **Appendix 4**. Installation of ROW access restrictions (e.g., stone, bollards, other) at road crossings also require consultation with the National Grid Environmental Scientist and Property Legal.

14.0 Signage

Specific signage may be required by permits or be specified in the EFI to limit access in certain sensitive areas. Signs shall be used to clarify allowed access and sensitive areas, such as:

- "No snow stockpiling beyond this point";
- "Approved access (to structures A-F)";
- "Do not cross this area until construction mats are in place";
- "No vehicle crossing";
- "Areas to avoid"; and
- "Environmentally Sensitive Area – Keep Out."

Signs shall be used in conjunction with snow fencing or other physical barriers as demarcation for sensitive areas (e.g., rare species areas, sensitive archeological locations, etc.) that need to be protected and avoided by construction activities. In addition, permit signs required by the regulatory agencies shall be present (i.e. MADEP, RIDEM, EPA (SWPPP), ACOE, etc) at construction sites and/or ROW access points. Construction signage shall be installed and maintained by the contractor performing the work during the project. Absence of signage does not eliminate the need to comply with access plans, permit conditions, and other regulatory requirements. Refer to BMPs in **Appendix 4**.

15.0 Refueling and Maintenance Operations

15.1 Spill Prevention and Response Plan

Spill controls shall be provided on every field vehicle. Bulk storage of fuels (55 gallons or greater) shall be approved by the National Grid Environmental Scientist prior to being brought on site. The need for a field spill plan shall be evaluated specific to the project for regulatory requirements under SPCC regulations or local ordinances. A field spill plan would include information on fuels and oils being used, approximate amounts in each container or type of equipment, location, fueling location, secondary containment, response and notification procedures, including contact phone numbers, etc. All

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	31 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England	REFERENCE EP-3; Natural Resource Protection	

personnel shall be briefed on spill prevention and response prior to the commencement of construction. The state-specific EI-501 and EG-502 shall be followed in the event of a spill.

Typical construction activities do not require the use or storage of large quantities of oil or hazardous materials (i.e., greater than 55 gallons). However, oil and/or hazardous materials (OHM) may be required in limited quantities to support construction or vehicle operations. Best practices shall be followed in the use and storage of OHM which include but are not limited to: storage and refueling greater than 100 feet from resource areas; maintenance of spill response equipment at work locations sufficient to handle incidental releases from operating equipment; general training for on-site personnel for spill clean up response for incidental releases of OHM; and contracting with an on-call spill response contractor that is capable of managing incidental and significant releases of OHM. There may situations that additional precautions shall be required for the storage or use of OHM (i.e., within wellhead protection areas, GA/GAA areas, Zone IIs). Storage of OHM shall be done in accordance with any applicable regulatory requirements.

15.2 Field Refueling

Small equipment such as pumps and generators shall be placed in small swimming pools or on absorbent blankets/pads, to contain any accidental fuel spills. Small swimming pools with absorbent blankets/pads, and/or other secondary containment, shall be used for refueling of fixed equipment in wetlands and should be maintained to prevent accumulation of precipitation.

15.3 Grease, Oil, and Filter Changes

Routine vehicle maintenance shall not be conducted on project sites.

15.4 Other Field Maintenance Operations

When other vehicle or equipment maintenance operations (such as emergency repairs) occur, company personnel or contractors at field locations shall bring vehicles or equipment to an access location a minimum of 100 feet away from environmentally sensitive areas (e.g., wetlands or drinking water sources). A paved area, such as a parking lot or roadway, is a preferred field maintenance location to minimize the possibility of spills or releases to the environment.

Crews shall take all usual and reasonable environmental precautions during repair or maintenance operations. Occasionally, it is infeasible to move the affected vehicle or equipment from an environmentally sensitive area to a suitable access area. When this situation occurs, precautions shall be taken to prevent oil or hazardous material release to the environment. These precautions include (but are not limited to) deployment of portable basins or similar secondary containment devices, use of ground covers, such as plastic tarpaulins, and precautionary placement of floating booms on nearby surface water bodies.

15.5 Tools and Equipment

Cleaning of tools and equipment shall be conducted away from environmentally sensitive areas (such as wetlands, buffer zones or drinking water sources) to the maximum extent possible. A paved area such

Approved for use per EP – 10, Document Control.

	Page No.:	32 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England		REFERENCE EP-3; Natural Resource Protection

as a parking lot or roadway is preferred, to minimize the possibility of spill or release to the environment. Crews shall wipe up all minor drips or spills of grease and oil at field locations.

16.0 Stabilization Deadlines for Projects Subject to EPA Construction General Permit

16.1 Deadlines to Initiate Stabilization Activities (Permanent and Temporary)

Soil stabilization measures shall be implemented immediately whenever earth-disturbing activities have permanently or temporarily ceased on any portion of the project. The following are some examples of activities that constitute initiation of stabilization:

- Preparing the soil for vegetative or non-vegetative stabilization;
- Applying mulch or other non-vegetative product to the exposed area;
- Seeding or planting the exposed area;
- Finalizing the arrangements to have stabilization product fully installed in compliance with the deadlines to complete stabilization in Section 15.2 below.

16.2 Deadlines to Complete Stabilization Activities (Permanent and Temporary)

As soon as practicable, but no later than 14 calendar days or 7 calendar days (for areas discharging to a sensitive water) after the initiation of soil stabilization measures commence the following should be completed:

- For vegetative stabilization, all activities necessary to initially seed or plant the area to be stabilized; and
- For non-vegetative stabilization, the installation or application of all such non-vegetative measures.

16.3 Vegetative Stabilization (all except for arid, semi-arid, or on agricultural lands)

- Provide established uniform vegetation (e.g., evenly distributed without large bare areas), which provides 70% or more of the density of coverage that was provided by vegetation prior to commencing earth-disturbing activities. Avoid the use of invasive species as cover.
- For final stabilization, vegetative cover must be perennial; and
- Immediately after seeding or planting a disturbed area to be vegetatively stabilized, a non-vegetative erosion control must be implemented to the area while the vegetation is becoming established. Examples include; mulch and rolled erosion control products.

16.4 Vegetative Stabilization (Agricultural Lands)

- Disturbed areas on land used for agricultural purposes that are restored to their pre-construction agricultural use are not subject to vegetative stabilization standards.

16.5 Non-Vegetative Stabilization

If using non-vegetative controls to stabilize exposed portions of your site, or if you are using such controls to temporarily protect areas that are being vegetatively stabilized, you must provide effective

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	33 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England	REFERENCE EP-3; Natural Resource Protection	

non-vegetative cover to stabilize any such exposed portions of the site. Examples of non-vegetative stabilization techniques include, but are not limited to, rip-rap, gabions, and geotextiles.

17.0 Clean-up and Restoration Standards

The following steps shall be taken once construction has been completed at each location along the ROW or within the project site. The following are minimum guidelines for clean-up and stabilization standards. Please refer to permit conditions for project-specific related standards. Refer to the EFI for applicable permit requirements and to determine if the site needs to be reviewed and approved by the permitting authorities prior to removal of erosion controls.

17.1 Removal of Sedimentation and Erosion Controls

After all work has been satisfactorily completed and vegetation has been re-established to a minimum of 75% cover, and upon approval by the National Grid Environmental Scientist, all non-biodegradable materials (e.g., siltation fencing, straw bale strings, stakes, straw wattle mesh casing, etc.) shall be disposed of properly off-site.

Dependent on permit requirements, sedimentation and erosion controls may not be allowed to be removed until after inspection and approval by one or more permitting authority. In most cases, removed straw bales may be used to mulch disturbed areas. Remaining straw bales that do not block the flow of water may be left in place unless they are required to be removed pursuant to permit conditions. Straw bales that block the flow of water shall be removed.

Prior to project construction being completed, the project team will develop post-construction inspection intervals to ensure timely removal of temporary BMPs. BMPs will be removed when the area is stabilized, which typically occurs when the area has either naturally stabilized (75% cover), or seed and mulch that was installed has achieved 75% cover.

17.2 In-Situ Restoration

Unless otherwise specified in permits or prescribed by the National Grid Environmental Scientist or the Project Environmental Consultant, all disturbed areas, including stream banks, wetlands and access routes, shall be restored following the completion of work. When the work is completed and construction mats have been removed, the National Grid Environmental Scientist or Project Environmental Consultant shall conduct an inspection. Wetlands shall be inspected for build up of sand or other materials that may have fallen through construction mats. Care shall be taken to inspect wetland crossings carefully after construction mat removal to ensure any materials are properly removed and disposed of off-site.

Restoration of Soil Compaction. If rutting or soil compaction following construction mat removal is observed, the area shall be returned to pre-existing conditions, and comparable to the surrounding area, by light hand raking or by back-blading with machinery. Restoration shall be overseen by the Project Environmental Consultant or National Grid Environmental Scientist. Deep ruts (>12") shall be filled in using available, loose soil from the work area.

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	34 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England	REFERENCE EP-3; Natural Resource Protection	

Seeding and Mulching. If adequate root and seed stock are absent and have been stripped from the area, graded sites shall be promptly stabilized by applying an approved seed mix and mulching with straw to reduce erosion and visual impact. Seeding and mulching shall be completed as soon as possible following completion of work at the site. For some wetland areas, natural re-vegetation may be more appropriate than seeding disturbed sites. Wetland areas where adequate root and seed stock are absent will be seeded using an approved wetland native seed mix. For some wetland areas, natural re-vegetation may be more appropriate than seeding disturbed sites. Refer to BMPs in **Appendix 4** for seed mix tables and mulch ratio tables.

If needed, the import of quality topsoil onto the ROW will be required. Topsoil should be tested, and approved by the Project Environmental Consultant or National Grid Environmental Scientist to determine its suitability for site conditions. Fertilizers will be approved on a case-by-case basis.

For upland areas, the disturbed vegetation and soil shall be restored and stabilized⁴ by regrading the area to pre-existing conditions, if needed, seeding (if adequate root and seed stock are absent) and mulching the exposed soil, and removing strings and stakes from straw bales and using broken up straw bales for the mulch. Siltation fencing, strings and stakes shall be removed for disposal as ordinary waste. Refer to BMPs in **Appendix 4** for seed mix tables and mulch ratio tables.

For sites with excess boulders, additional boulders could be used at proposed and existing gate locations to use on either side of the gates as a deterrent for unauthorized vehicle access or be placed along the edges of work pads where steep slopes are present for safety purposes. The final placement of boulders should be reviewed prior to installation with Real Estate and the National Grid Environmental Scientist or Project Environmental Consultant.

Unless otherwise specified in Project-specific permit conditions, the National Grid Environmental Scientist or Project Environmental Consultant shall develop an inspection frequency to monitor restored areas for stabilization, germination and successful revegetation.

17.3 Invasive Species

All equipment shall be certified clean⁵ utilizing the attached form (**Appendix 5**) or equivalent as approved by the vendor prior to mobilization to the work site. The vendor shall use the certification from provided as **Appendix 5** to document compliance with invasive species management BMPs. Clean is defined as being free of plant matter (stems, flowers, roots, etc), soil, or other deleterious materials prior to being brought to the project site. Any equipment that has been placed or used within areas containing invasive species within the project site shall be cleaned of plant matter (stems, flowers, roots, etc), soil, or other deleterious materials at the site of the invasive species prior to being moved to other areas on the project

⁴ For projects subject to the 2012 CGP, stabilization is required within 14 days, or within 7 days for sensitive areas.

⁵ The **Appendix 5** certification form (or equivalent as approved by National Grid Environmental Scientist) shall be used to document the clean certification

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	35 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England		REFERENCE EP-3; Natural Resource Protection

site to prevent the spread of invasive species from one area to another⁶. **Equipment shall be cleaned prior to being removed at the completion of the project: exceptions to this requirement shall be determined on a case-by-case basis.** Consult with the National Grid Environmental Scientist prior to discharging or disposing of any waste water or waste material from the cleaning of equipment.

17.4 Cleaning of Equipment

At the completion of the project, equipment shall be cleaned prior to being de-mobilized to prevent tracking of material onto roads and causing safety issues. Consult with the National Grid Environmental Scientist prior to discharging or disposing of any waste water or waste material from the cleaning of equipment.

17.5 Access Roads

Constructed gravel roads shall be left in place following project completion unless permit conditions require their removal. Refer to the specific permit conditions for these provisions. If the road is to be removed, the crushed stone and geotextile fabric shall be removed from the work site. Seeding and/or mulching of gravel roads is generally not required, unless necessary to prevent erosion. Pre-existing sandy soils within mapped rare turtle habitat shall not be seeded unless directed by the National Grid Environmental Scientist so as to not alter nesting habitat.

17.6 Stone Work Pads

Unless permit conditions or property owner’s require the removal of constructed stone work pads following project completion, constructed work pads shall be left in place. Refer to the specific permit conditions for these provisions.

17.7 Construction Materials on ROWs

As soon as the structure work has been completed, all used parts and trash are to be picked up and removed from the project site. Retired poles shall be removed in accordance with National Grid Engineering Standard SP.06.01.301. In some cases, the used material from structure work may be temporarily stored at the work area by placing it out of the wetlands or other sensitive resource area until work in the adjacent areas has been completed. However, treated wood poles shall never be stored in standing water or in wetlands. If the project is cancelled, all material shall be removed from the project site. Excess material brought to the project site shall be removed upon project completion. Consult with the National Grid Environmental Scientist on whether the work site shall be restored in addition to the measures outlined above

17.8 Improved Areas

Yards, lawns, agricultural areas, and other improved areas shall be returned to a condition at least equal to that which existed at the start of the project. Off-ROW access shall never be assumed and shall be coordinated through Real Estate before being implemented. Depending on the access point, construction matting or other BMPs may be required to prevent ruts, lawn damage, or other property damage.

⁶ On ROW projects where multiple wetlands may be dominated by the same invasive species, cleaning may not be required for movement along the ROW. Check with the National Grid Environmental Scientist for guidance.

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	36 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England	REFERENCE EP-3; Natural Resource Protection	

Restoration following the completion of work and any use of improved areas shall be conducted in accordance with the measures outlined above.

17.9 Property Damage

All damage to property occurring as a result of a project shall be immediately repaired or replaced. In some locations, it may be desirable to document pre-existing damage prior to work commencing in that area in order to demonstrate afterwards that the damage did not result from the project. Work crews, the Project Environmental Consultant or the National Grid Environmental Scientist shall document repairs that were performed in response to damage from unauthorized vehicle use.

17.10 Overall Work Site

Upon satisfactory completion of work, the construction personnel shall remove all work-related trailers, buildings, rubbish, waste soil, temporary structures, and unused materials belonging to them or used under their direction during construction, or waste materials from previous construction and maintenance operations. All areas shall be left clean, without any litter or equipment (wire, pole butts, anchors, insulators, cross-arms, cardboard, coffee cups, water bottles, etc.) and restored to a stable condition and as near as possible to its original condition, where feasible. Debris and spent equipment shall be returned to the operating facility or contractor staging area for disposal or recycling (cardboard) as appropriate in accordance with EI-111.

17.11 Material Storage/Staging and Parking Areas

Upon completion of all work, all material storage yards, staging areas, and parking areas shall be completely cleared of all waste and debris. Unless otherwise directed or unless other arrangements have been made with an off ROW or off-property owner, material storage yards and staging areas shall be returned to the condition that existed prior to the installation of the material storage yard or staging area. Regardless of arrangements made with a landowner, all areas shall be restored to their pre-construction condition or better. Also any temporary structures erected by the construction personnel, including fences, shall be removed by the construction personnel and the area restored as near as possible to its original condition, including seeding and mulching as needed.

18.0 Notification of Emergency Work

Because it is sometimes difficult to identify wetlands and other sensitive environmental areas, the National Grid Environmental Scientist shall be notified within 24 hours or by the next working day whenever emergency off-road repair work takes place. Although the routine maintenance and emergency repair work is generally allowed, due to site conditions or the scope of the project, notification to the regulating agencies may be required.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	38 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England	REFERENCE EP-3; Natural Resource Protection	

Appendix 1 – Glossary

Access Road – An existing, periodically maintained road often consisting of gravel and/or exposed soils or vegetated with grasses but devoid of woody vegetation, that is visible on aerial photography and shown on ROW T-sheets. May include newly permitted permanent roads (i.e., roads to be constructed in accordance with a project-specific permit).

Access Route - A pathway previously used or proposed to be used by crews for access along the ROW. Routes may be shown on ROW T-sheets or previous project access plans but are not improved as maintained gravel/exposed soil roads. Access routes may be mown and can consist of trails utilized by recreational vehicles.

Action Logs – Project-specific log used to document action items required for permit compliance. The log identifies timeframes for completion and responsible parties. The log is typically updated by the Project Environmental Consultant or the National Grid Environment Scientist and circulated to the project team on a weekly, or more frequent, basis.

Bank – The transitional slope immediately adjacent to the edge of a surface water body, the upper limit of which is usually defined by a break in slope, or, for a wetland, where a line delineated in accordance with applicable state and federal regulations that indicates a change from wetland to upland.

BMP – Best Management Practice. Individual engineered constructions or operating procedures intended to minimize and mitigate soil disturbance, erosion, sedimentation, turbid discharges, and/or impacts to sensitive receptors.

Clean - Free of plant matter (stems, flowers, roots, etc), soil, or other deleterious materials prior to being brought to the project site.

Clean Gravel – Gravel is a type of coarse-grained soil that consists of small stones and other mineral particles. Clean Gravel shall meet the requirements in accordance with National Grid Standard Construction Specification for Electric Stations (Engineering Standard SP.08.00.001) Clean Gravel will not have fine materials that could lead to a turbid discharge.

Clean Stone (Crushed Stone) – Clean Stone (Crushed Stone) shall meet the requirements in accordance with National Grid Standard Construction Specification for Electric Stations (Engineering Standard SP.08.00.001). Clean Stone will not have fine materials that could lead to a turbid discharge.

Clearing – The cutting of trees and large bushes by hand and/or mechanical means.

Compost Socks – Tubular devices comprised of non-degradable, photodegradable, or biodegradable mesh tubing containing organic compost matrix. Compost socks are effective for intercepting site runoff, trapping

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE

	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England	REFERENCE EP-3; Natural Resource Protection	

sediment, and treating for soluble pollutants by filtering stormwater runoff. . Compost socks are a useful sedimentation control device along construction site perimeters, as check dams in drainage channels, as a slope interruption practice on long and/or steep slopes, and around drain or street curb inlets.

Construction Mats - Construction, swamp, and timber mats (“construction mats”) are generic terms used to describe structures that distribute equipment weight to minimize disturbance to wetland soil and vegetation while facilitating passage and providing work platforms for workers and equipment. They are comprised of sheets or mats made from a variety of materials in various sizes.

Corduroy Road – Corduroy roads are cut trees and/or saplings with the crowns and branches removed, and the trunks lined up next to one another.

Dewatering Basin – An established containment area for saturated materials and pumped discharges. This measure is used for the purpose of de-watering soils prior to transport off site or for use in another location on site, and for allowing suspended sediment to settle out of pumped discharges.

Detention/Retention Basin – A detention/retention basin is designed for the purpose of detaining or retaining water. A dewatering basin is a form of detention basin

Dewatering – Use of a system of pumps, pipes and temporary holding dams to drain or divert waterways or wetlands, or lower the groundwater table before and during excavation activities.

Drainage Ditch or Swale – A clearly noticeable channel that is typically dry, except after precipitation events. Intermittent and perennial streams and rivers are not included in this definition.

Dredge – To dig, excavate, or otherwise disturb the contour or integrity of sediments in the bank or bed of a wetland, a surface water body, or other area within the regulating bodies’ jurisdiction.

Dredge Spoils – Material removed as the result of dredging.

Embankment – A protective bank constructed of mounded earth or fill materials located between a roadway (or rail bed) and a seasonal stream or other wetland.

Environmental Field Issue – Document that contains copies of all project-specific environmental permits and summarizes all environmental permit conditions. The EFI is prepared by the Project Environmental Consultant or the National Grid Environment Scientist and copies are provided to the Project Manager, Construction Supervisor(s), and other team members as appropriate.

Environmental Monitoring Records – Examples of checklists and/or monitoring reports suggested for use by the Company Environmental Engineer to document conformance of the project with this Environmental Guidance and or project specific permit/license conditions.

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	40 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England	REFERENCE EP-3; Natural Resource Protection	

Environmental Scientist – Formerly Environmental Engineer. The National Grid Environmental Department representative for the project or the territory where the work is located. For a map of Environmental Department staff territories, refer to the Environmental page of the National Grid infonet.

Environmentally Sensitive Areas – Examples of environmentally sensitive areas that may be found on National Grid properties are rivers, streams, ponds, lakes, wetlands, bogs, swamps, salt marshes, rare species habitat, wellhead protection areas, cultural sites, parks, preserves, schools and as otherwise defined by Federal, State or local regulations. Refer to EG-301.

Erosion Controls – The utilization of methods to prevent soil detachment and minimize displacement or washing down slopes by rainfall or run-off. Common practices include, but are not limited to:

- (a) Temporary and Permanent Seeding.
- (b) Mulching, Soil Binders, Tackifiers.
- (c) Erosion Control Blankets.
- (d) Hydraulic Erosion Control.

Excavate/Excavation – To dig, remove, or form a cavity or a hole in an area within the department’s jurisdiction.

Fill (n.) – Any rock, soil, gravel, sand or other such material that has been deposited or caused to be deposited by human activity.

Fill (v.) – To place or deposit materials in or on a wetland, surface water body, bank or otherwise in or on an area within the jurisdiction of the department.

Flats – Relatively level landforms composed of unconsolidated mineral and organic sediments usually mud or sand, that are alternately flooded and exposed by the tides and that usually are continuous with the shore.

Frozen Condition – Field conditions when the upper portion of the ground surface freezes or when areas of standing water freeze solid such that vehicle passage over these areas is supported without any resulting soil disturbance. The frozen conditions must have been affected by severe cold (maximum daily temperatures less than 32 degrees F) for a continuous 2-week period.

GAA – Rhode Island groundwater classification, groundwater resources that are known, or presumed to be suitable for drinking water use without treatment, and are located in one of the three areas described below.

a) The state’s major stratified drift aquifers that are capable of serving as a significant source for a public water supply (“groundwater reservoirs”) and the critical portion of their recharge area as delineated by DEM;

b) The wellhead protection area for each public water system community water supply well. Community water supply wells are those that serve resident populations and have at least 15 service

Approved for use per EP – 10, Document Control.

	Page No.:	41 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England	REFERENCE EP-3; Natural Resource Protection	

connections or serve at least 25 individuals, e. g. municipal wells and wells serving nursing homes, condominiums, mobile home parks, etc.; and

c) Groundwater dependent areas that are physically isolated from reasonable alternative water supplies and where existing groundwater warrants the highest level of protection. At present only Block Island has been designated as meeting this criterion.

GA – Rhode Island groundwater classification, groundwater resources that are known, or presumed to be suitable for drinking water use without treatment. However, groundwater classified by GA does not fall within any of the three priority areas described under the GAA classification.

Grade/Grading – The movement of soil and fill material to change the elevation of the land. The term refers to the combined actions of excavating and filling to change elevation or shape.

Grubbing – The removal of stumps/roots by mechanical means during site preparation activities.

Immediately - As soon as practicable, but no later than the end of the next work day, following the day when the earth-disturbing activities have temporarily or permanently ceased.

In-kind Replacement - Replacement using the same material, functional inverts, diameter and length as the existing item. In-kind replacement includes the substitution of a structure with a similar structure in approximately the same location as is practicable, and is approximately the same in design. The design may be altered to meet applicable utility standards, and may include alternate materials designed to prolong the life of that service.

Intermittent Stream – A stream that flows for sufficient time to develop and maintain a defined channel, but which might not flow during dry portions of the year.

In the Dry – Work done either during periods of low water or behind temporary diversions, such as Earth Dike / Drainage Swale and Lined Ditches designed and installed in accordance with best management practices.

Limit of Work/Disturbance – The approved project limits within regulated areas. All project related activities in regulated areas must be conducted within the approved limit of work/disturbance. The limit of work/disturbance shall be depicted on the approved permit site plans and in the EFI plans. Where it is warranted National Grid may require that these limits be identified in the field by flagging, construction fencing, and/or perimeter erosion controls.

Long-Term Restoration Logs - Project-specific log used to document restoration required following the completion of construction or as areas of the project have been completed (i.e., segments of ROW for a multi-mile project). The log is typically updated by the Project Environmental Consultant or the National Grid Environment Scientist and circulated to the project team on a weekly basis.

Approved for use per EP – 10, Document Control.

	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England	REFERENCE EP-3; Natural Resource Protection	

Low Flow Conditions – Low water flow that generally occurs during the summer, as a result of decreased precipitation and the removal of water by increased evaporation and evapotranspiration by vegetation. Work done under low-flow conditions minimizes the potential for environmental damage. The USACE defines the calendar dates for low flow conditions in its New England state-specific Programmatic General Permits.

Low Ground Pressure – Equipment that meets the USACE GP state-specific defined Pounds per Square Inch (PSI) ground pressure when loaded. Use of LGP equipment **requires approval** from the National Grid Environmental Scientist.

Marsh – A wetland:

- a) That is distinguished by the absence of trees and shrubs;
- b) Dominated by soft-stemmed herbaceous plants such as grasses, reeds, and sedges; and
- c) Where the water table is at or above the surface throughout the year, but can fluctuate seasonally.

Methods – Are the construction practices and procedures that take place through choosing the proper equipment, trucks and labor to execute the earth moving activities based on the existing conditions and implementing creative and sensitive scheduling for the daily activities.

NHESP - Natural Heritage Endangered Species Program; a department within the Massachusetts Division of Fisheries and Wildlife that is responsible for protecting the 176 species of vertebrate and invertebrate animals and 259 species of native plants that are officially listed as Endangered, Threatened or of Special Concern in Massachusetts.

Perennial – A stream that contains water at all times except during extreme drought.

Permanently Ceased – Is applicable to earth disturbance activities when clearing and excavation within any area of the Project that will not include permanent structures has been completed.

Person-in-Charge – A National Grid Project Engineer, Manager, Supervisor, Field Construction Coordinator or equivalent Contractor personnel assigned to oversee and coordinate work activities.

Processed Gravel – Processed Gravel shall meet the requirements in accordance with National Grid Standard Construction Specification for Electric Stations (Engineering Standard SP.08.00.001). Processed Gravel will not have fine materials that could lead to a turbid discharge. Gravel consisting of inert material that is hard, durable stone and is free from loam and clay, surface coatings and deleterious materials.

Regulating Body – Federal, State, or local authority that has jurisdiction over resource areas that may be impacted by company operations

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England	REFERENCE EP-3; Natural Resource Protection	

Regulated Wetland Area – Those areas that are subject to federal, state or local wetland regulation, including certain buffer or adjacent areas.

Repair – The restoring of an existing legal structure by partial replacement of work, or broken, or unsound parts (Env-Wt 101.73).

Replacement – The substitution of a new structure for an existing legal structure with no change in size, dimensions, location, configuration, construction, or which conforms in all material aspects to the original structure

Right-of-Way – A corridor of land where National Grid has legal rights (either fee ownership, lease or easement) to construct, operate, and maintain an electric power line and/or natural gas pipeline and may include work on customer owned properties.

River – A watercourse that is larger than a perennial stream and flows all year long.

Routine Utility Rights-of-Way Maintenance Activity – Includes but is not limited to vegetation management and repair or replacement of existing utility structures.

Sedimentation Controls – Silt fences, straw bales, compost socks/berms and other barrier devices strategically placed to intercept and treat sediment-laden site runoff.

Sensitive Water - Includes any sediment or nutrient impaired water or a water that is identified by the state, tribe or EPA as Tier 2, 2.5 or Tier 3 for antidegradation purposes.

Siltation Curtain – An impervious barrier erected to prevent silt and sand and/or fines from being washed into a wetland, surface water body or other area of concern.

Surface Water Body or Surface Waters – Those portions of waters which have standing or flowing water at or on the surface of the ground.

Spill Prevention, Control and Countermeasure Plans – Required for site operations that involve the storage of 1,320 gallons or greater of fuel and oils, both in storage containers and stored in equipment. Response actions to spills and releases are specified in these plans.

Stormwater Pollution Prevention Plan – A site-specific, written document that, among other things: (1) identifies potential sources of stormwater pollution at a construction site; (2) describes stormwater control measures to reduce or eliminate pollutants in stormwater discharge from a construction site; and (3) identifies procedures the operator will implement to comply with the terms and conditions of EPA NPDES Construction General Permit (CGP). SWPPPs must be prepared, maintained on-site, and amended as necessary in order to obtain NPDES permit coverage for specific construction site stormwater discharges under the EPA NPDES CGP.

Approved for use per EP – 10, Document Control.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED. FOR LATEST AUTHORIZED VERSION PLEASE REFER TO THE NATIONAL GRID ENVIRONMENTAL INFONET SITE.

 National Grid Environmental Guidance	Doc No.:	EG-303NE
	Rev. No.:	15
	Page No.:	44 of 50
	Date:	08/06/2020
SUBJECT ROW Access, Maintenance and Construction Best Management Practices for New England	REFERENCE EP-3; Natural Resource Protection	

Temporarily Ceased - Is applicable when there are earth disturbance activities such as clearing, grading, and/or excavation that are not complete, but will be idle in one area for a period of up to 14 or more calendar days, and which will resume in the future. The 14 calendar day timeframe begins as soon as you now that construction work on a portion of the Project will be left incomplete and idle. In circumstances where there are unanticipated delays and you do not know at first how long the work stoppage will continue, the requirement to immediately initiate stabilization is triggered as soon as you know with reasonable certainty that work will be stopped for 14 or more additional calendar days.

Tidal Wetlands – A wetland whose vegetation, hydrology or soils are influenced by periodic inundation or tidal waters.

Topsoil – The uppermost part of the soil, ordinarily moved in tillage, or its equivalent in uncultivated soils and ranging in depth from 2 to 10 inches.

Turbidity – The condition in which solid particles suspended in water make the water cloudy or even opaque in extreme cases.

United States Geological Survey Topographic Map – A map that uses contour lines to represent the three-dimensional features of a landscape on a two-dimensional surface. These maps use a line and symbol representation of natural and artificially created features in an area.

Wetland – An area that is inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal conditions does support, a prevalence of vegetation (more than 50 percent) typically adapted for life in saturated soil conditions (hydric soils). Wetlands include but are not limited to swamps, marshes, bogs, and similar areas.

Work Site – An area where work is performed.

Worker – Company employee, contractor, consultant working on site.

Zone II - Massachusetts - That area of an aquifer which contributes water to a well under the most severe pumping and recharge conditions that can be realistically anticipated (180 days of pumping at safe yield, with no recharge from precipitation). It is bounded by the groundwater divides which result from pumping the well and by the contact of the aquifer with less permeable materials such as till or bedrock. In some cases, streams or lakes may act as recharge boundaries. In all cases, Zone IIs shall extend up gradient to its point of intersection with prevailing hydrogeologic boundaries (a groundwater flow divide, a contact with till or bedrock , or a recharge boundary).

Approved for use per EP – 10, Document Control.

APPENDIX 5
CERTIFICATION FORM FOR INVASIVE SPECIES CONTROL

Certain permit conditions, therefore a Condition of Contracts for the Prime Contractor, any Subcontractors, and any equipment or mat vendors for **National Grid Projects** shall be required to Certify their equipment⁷ {each piece of equipment used on site} as 'clean'⁸.

_____ (name of firm) hereby Certifies that
 _____ (make, model, and/or type)
 _____ (equipment ID tag or #) meets the following

1. before entry on to the job site, has been sufficiently cleaned to remove all accumulated mud, debris, plant fragments, and detritus that could harbor seeds, roots, or plant fragments of so-called invasive plant species; and
2. that the above piece of equipment has neither been off-loaded nor operated in the interval between cleaning and delivery to the jobsite.
3. that equipment deployed in areas of invasive species (as identified in project plans) shall be cleaned prior to redeployment.

_____ (signed) _____ (dated)
 _____ (printed name) _____ (title)
 _____ (Firm)

The signed original of this form {one for each piece of equipment (or lot⁹ of mats)} is to be given to the NG Construction Supervisor assigned to the project.

⁷ Equipment may include, but is not limited to bulldozers, excavators, backhoes, bucket trucks (tracked or wheeled), pulling equipment, concrete trucks, compressors, drilling equipment, and mats (composite, wood, or other materials).
⁸ With regard to invasive species, the definition of clean means free of accumulated mud, debris, plant fragments, and detritus that could harbor seeds, roots, or plant fragments of so-called invasive plant species.
⁹ Lot of mats is the number of mats that may be transported by one forwarder/truck at a time.

NOTES:

1. PRODUCT TO BE TENSAR NORTH AMERICAN GREEN STRAW WATTLE OR APPROVED EQUAL BY NATIONAL GRID ENVIRONMENTAL SCIENTIST.
2. TYPICAL WATTLE SPACING BASED ON SLOPE GRADIENT. COORDINATE SPACING AND LOCATION WITH NATIONAL GRID ENVIRONMENTAL SCIENTIST.
3. MINIMUM 12" DIAMETER WATTLES SHOULD BE USED FOR HIGHLY DISTURBED AREAS (I.E., HEAVILY USED ACCESS ROAD WITH ADJACENT WETLAND) AND MINIMUM 9-10" WATTLES SHOULD BE USED FOR LESS DISTURBED SOILS.

INSTALLATION NOTES:

1. BEGIN AT THE LOCATION WHERE THE WATTLE IS TO BE INSTALLED BY EXCAVATING A 2-3" DEEP X 9" WIDE TRENCH ALONG THE CONTOUR OF THE SLOPE. EXCAVATED SOIL SHOULD BE PLACED UPSLOPE FROM THE ANCHOR TRENCH.
2. PLACE THE WATTLE IN THE TRENCH SO THAT IT CONTOURS TO THE SOIL SURFACE. COMPACT SOIL FROM THE EXCAVATED TRENCH AGAINST THE WATTLE ON THE UPHILL SIDE. ADJACENT WATTLES SHOULD TIGHTLY ABUT.
3. SECURE THE WATTLE WITH 18-24" HARDWOOD STAKES EVERY 3-4' AND WITH A STAKE ON EACH END. STAKES SHOULD BE DRIVEN THROUGH THE MIDDLE OF THE WATTLE LEAVING AT LEAST 2-3" OF STAKE EXTENDING ABOVE THE WATTLE. STAKES SHOULD BE DRIVEN PERPENDICULAR TO THE SLOPE FACE.

BMP DETAIL

INSTALLATION NOTES:

1. PREPARE SOIL BEFORE INSTALLING ROLLED EROSION CONTROL PRODUCTS (RECP's), INCLUDING ANY NECESSARY APPLICATION OF LIME, FERTILIZER, AND SEED. NOTE: WHEN USING CELL-O-SEED DO NOT SEED PREPARED AREA. CELL-O-SEED MUST BE INSTALLED WITH PAPER SIDE DOWN.
2. BEGIN AT THE TOP OF THE CHANNEL BY ANCHORING THE RECP's IN A 6" (15 CM) DEEP X 6" (15 CM) WIDE TRENCH WITH APPROXIMATELY 12" (30 CM) OF RECP's EXTENDED BEYOND THE UP-SLOPE PORTION OF THE TRENCH. ANCHOR THE RECP's WITH A ROW OF STAPLES/STAKES APPROXIMATELY 12" (30 CM) APART IN THE BOTTOM OF THE TRENCH. BACKFILL AND COMACT THE TRENCH AFTER STAPLING. APPLY SEED TO COMPACTED SOIL AND FOLD REMAINING 12" (30 CM) PORTION OF RECP's BACK OVER SEED AND COMPACTED SOIL. SECURE RECP's OVER COMPACTED SOIL WITH A ROW OF STAPLES/STAKES SPACED APPROXIMATELY 12" (30 CM) ACROSS THE WIDTH OF THE RECP's.
3. ROLL CENTER RECP's IN DIRECTION OF WATER FLOW IN BOTTOM OF CHANNEL. RECP's WILL UNROLL WITH APPROPRIATE SIDE AGAINST THE SOIL SURFACE. ALL RECP's MUST BE SECURELY FASTENED TO SOIL SURFACE BY PLACING STAPLES/STAKES IN APPROPRIATE LOCATIONS AS SHOWN IN THE STAPLE PATTERN GUIDE. WHEN USING THE DOT SYSTEM, STAPLES/STAKES SHOULD BE PLACED THROUGH EACH OF THE COLORED DOTS CORRESPONDING TO THE APPROPRIATE STAPLE PATTERN.
4. PLACE CONSECUTIVE RECP's END OVER END (SHINGLE STYLE) WITH A 4" - 6" (10 CM -15 CM) OVERLAP. USE A DOUBLE ROW OF STAPLES STAGGERED 4" (10 CM) APART AND 4" (10 CM) ON CENTER TO SECURE RECP's.
5. FULL LENGTH EDGE OF RECP's AT TOP OF SIDE SLOPES MUST BE ANCHORED WITH A ROW OF STAPLES/STAKES APPROXIMATELY 12" (30 CM) APART IN A 6" (15 CM) DEEP X 6" (15 CM) WIDE TRENCH. BACKFILL AND COMPACT THE TRENCH AFTER STAPLING.
6. ADJACENT RECP's MUST BE OVERLAPPED APPROXIMATELY 2" - 5" (5 CM -12.5 CM) (DEPENDING ON RECP's TYPE) AND STAPLED.
7. IN HIGH FLOW CHANNEL APPLICATIONS, A STAPLE CHECK SLOT IS RECOMMENDED AT 30 TO 40 FOOT (9 M - 12 M) INTERVALS. USE A DOUBLE ROW OF STAPLES STAGGERED 4" (10 CM) APART AND 4" (10 CM) ON CENTER OVER ENTIRE WIDTH OF THE CHANNEL.
8. THE TERMINAL END OF THE RECP's MUST BE ANCHORED WITH A ROW OF STAPLES/STAKES APPROXIMATELY 12" (30 CM) APART IN A 6" (15 CM) DEEP X 6" (15 CM) WIDE TRENCH. BACKFILL AND COMPACT THE TRENCH AFTER STAPLING.

HYDROSEEDING WITH TACKIFIER
(SLOPE STABILIZATION) *

SUBJECT

Access, Maintenance and Construction
Best Management Practices

Reference

EP No. 3 - Natural Resource
Protection (Chapter 6)

BMP

Definition

Applying coarse plant residue or chips, or other suitable materials, to cover the soil surface.

Purpose

The primary purpose is to provide initial erosion control while a seeding or shrub planting is establishing. Mulch will conserve moisture and modify the surface soil temperature and reduce fluctuation of both. Mulch will prevent soil surface crusting and aid in weed control. Mulch is also used alone for temporary stabilization in non-growing months.

Conditions Where Practice Applies

On soils subject to erosion and on new seedings and shrub plantings. Mulch is useful on soils with low infiltration rates by retarding runoff.

Criteria

Site preparation prior to mulching requires the installation of necessary erosion control or water management practices and drainage systems.

Slope, grade and smooth the site to fit needs of selected mulch products.

Remove all undesirable stones and other debris to meet the needs of the anticipated land use and maintenance required.

Apply mulch after soil amendments and planting is accomplished or simultaneously if hydroseeding is used.

Select appropriate mulch material and application rate or material needs. Determine local availability.

Select appropriate mulch anchoring material.

NOTE: The best combination for grass/legume establishment is straw (cereal grain) mulch applied at 2 ton/acre (90 lbs./1000sq.ft.) and anchored with wood fiber mulch (hydromulch) at 500 – 750 lbs./acre (11 – 17 lbs./1000 sq. ft.). The wood fiber mulch must be applied through a hydroseeder immediately after mulching.

NOTE:

1. PICTURE DEPICTS STRAW MULCH APPLICATION (FROM MULCH SPREADER) ON STEEP SLOPE WITH AN IMPROVED DRAINAGE SWALE.
2. COORDINATE MULCH MATERIALS AND RATES WITH NATIONAL GRID ENVIRONMENTAL SCIENTIST.

* BMP INFORMATION FROM "NEW YORK STANDARDS AND SPECIFICATIONS FOR EROSION AND SEDIMENT CONTROL (AUGUST, 2005)." INFORMATION OBTAINED VIA WEBSITE: <http://www.dec.ny.gov/chemical/29086.html>

UPLAND ROW RESTORATION MIX – GENERAL

Species Composition Options:

- Andropogon gerardii; Niagra Big Bluestem
- Schizachyrium scoparium; Little Bluestem
- Elymus Canadensis; Canada Wild Rye
- Elymus virginicus; Virginia Wildrye
- Lolium multiflorum; Annual Ryegrass
- Sorghastrum nutans; Indiangrass
- Chamaecrista fasciculata; Partridge Pea
- Desmodium canadense; Showy Tick Trefoil
- Heliopsis helianthoides; Ox–Eye Sunflower
- Panicum virgatum; Switchgrass
- Rudbeckia hirta; Black Eyed Susan
- Poa palustris; Fowl Bluegrass
- Agrostis perennans; Upland Bentgrass
- Agrostis alba; Redtop
- Festuca rubra; Red Fescue
- Lotus corniculatus; Birds–Foot Trefoil
- Chrysanthemum leucanthem; Ox–Eye Daisy
- Aster novae–angliae; New England Aster

Example Seed Mixes:

1. Native Upland wildlife forage and Cover Meadow Mix – Ernst Conservation Seeds (ERNMX–123)
2. Eastern Ecotype Native Grass Mix– Ernst Conservation Seeds (ERNMX–177)
3. New England Native Warm Season Grass Mix – New England Wetland Plants, Inc.
4. New England Logging Road Mix – New England Wetland Plants, Inc.
5. Northeast Upland Wildflower/Restoration Erosion Mix – Southern Tier Consulting (STCMX–2)

UPLAND ROW RESTORATION MIX – DRY/ROCKY SITES

Species Composition Options:

- Festuca rubra; Red Fescue
- Schizachyrium scoparium; Little Bluestem
- Elymus Canadensis; Canada Wild Rye
- Bouteloua gracillis; Blue Grama
- Lolium multiflorum; Annual Ryegrass
- Lolium perenne; Perennial Ryegrass
- Agrostis scabra; Rough Bentgrass
- Agrostis perennans; Upland Bentgrass
- Sorghastrum nutans; Indiangrass

Example Seed Mixes:

1. New England Erosion Control/ Restoration Mix for Dry Sites – New England Wetland Plants, Inc.
2. Ernst Conservation Seeds and similar companies can create a custom seed mix matching the composition above (with site specific additions if necessary).

WETLAND ROW RESTORATION MIX

Species Composition Options:

- Agrostis stolonifera; Creeping Bentgrass
- Poa trivialis; Rough Bluegrass
- Alopecurus arundinaceus; Creeping Meadow Foxtail
- Lolium multiflorum; Annual Ryegrass
- Festuca rubra; Creeping Red Fescue
- Elymus virginicus; Virginia Wildrye
- Schizachyrium scoparium; Little Bluestem
- Andropogon gerardii; Niagra Big Bluestem
- Carex vulpinoidea; Fox sedge
- Panicum virgatum; Switchgrass
- Agrostis scabra; Rough Bentgrass
- Aster novae-angliae; New England Aster
- Eupatorium perfoliatum; Boneset
- Euthamia graminifolia; Grass Leaved Goldenrod
- Scirpus atrovirens; Green Bulrush
- Verbena hastata; Blue Vervain
- Juncus effusus; Soft Rush
- Scirpus cyperinus; Wool Grass
- Panicum clandestinum; Deertongue

Example Seed Mixes

1. New England Erosion Control/Restoration Mix for Detention Basins and Moist Sites – New England Wetland Plants, Inc.
2. Northeast Wetland Grass Seed Mix – Southern Tier Consulting (STCMX-7)
3. Ernst Conservation Seeds and similar companies can create a custom seed mix matching the composition above (with site specific additions if necessary).

GERNERAL NOTES:

1. Seed mixes described herein are intended to cover a variety of typical new england landscapes. However, site specific seed mixes will need to be evaluated in coastal or mountainous regions.
2. Seed mixes described herein are intended for general ROW restoration. Site specific wetland seed mixes may be required by local, state and/or federal regulators for certain impacts to wetlands.
3. All seed mixes are to be approved by National Grid Environmental Scientist prior to construction and must conform with all project permits.
4. Seedbed preparation and maintenance as well as temporary erosion and sediment controls are crucial to the establishment of newly seeded areas. Coordinate with National Grid Environmental Scientist on seed bed preparation and maintenance as well as temporary erosion and sediment controls prior to construction.

BMP

Vegetative Cover – For disturbed areas not subject to traffic, vegetation provides the most practical method of dust control (see Section 3).

Mulch (including gravel mulch) – Mulch offers a fast effective means of controlling dust. This can also include rolled erosion control blankets.

Spray adhesives – These are products generally composed of polymers in a liquid or solid form that are mixed with water to form an emulsion that is sprayed on the soil surface with typical hydroseeding equipment. The mixing ratios and application rates will be in accordance with the manufacturer’s recommendations for the specific soils on the site. In no case should the application of these adhesives be made on wet soils or if there is a probability of precipitation within 48 hours of its proposed use. Material Safety Data Sheets will be provided to all applicators and others working with the material.

B. Driving Areas – These areas utilize water, polymer emulsions, and barriers to prevent dust movement from the traffic surface into the air.

Sprinkling – The site may be sprayed with water until the surface is wet. This is especially effective on haul roads and access routes.

Polymer Additives – These polymers are mixed with water and applied to the driving surface by a water truck with a gravity feed drip bar, spray bar or automated distributor truck. The mixing ratios and application rates will be in accordance with the manufacturer’s recommendations. Incorporation of the emulsion into the soil will be done to the appropriate depth based on expected traffic. Compaction after incorporation will be by vibratory roller to a minimum of 95%. The prepared surface shall be moist and no application of the polymer will be made if there is a probability of precipitation within 48 hours of its proposed use. Material Safety Data Sheets will be provided to all applicators working with the material.

Barriers – Woven geotextiles can be placed on the driving surface to effectively reduce dust throw and particle migration on haul roads. Stone can also be used for construction roads for effective dust control.

Windbreak – A silt fence or similar barrier can control air currents at intervals equal to ten times the barrier height. Preserve existing wind barrier vegetation as much as practical.

Definition

The control of dust resulting from land-disturbing activities.

Purpose

To prevent surface and air movement of dust from disturbed soil surfaces that may cause off-site damage, health hazards, and traffic safety problems.

Conditions Where Practice Applies

On construction roads, access points, and other disturbed areas subject to surface dust movement and dust blowing where off-site damage may occur if dust is not controlled.

Design Criteria

Construction operations should be scheduled to minimize the amount of area disturbed at one time. Buffer areas of vegetation should be left where practical. Temporary or permanent stabilization measures shall be installed. No specific design criteria is given; see construction specifications below for common methods of dust control.

Water quality must be considered when materials are selected for dust control. Where there is a potential for the material to wash off to a stream, ingredient information must be provided to the local permitting authority.

Construction Specifications

A. Non-driving Areas – These areas use products and materials applied or placed on soil surfaces to prevent airborne migration of soil particles.

APPENDIX 5
CERTIFICATION FORM FOR INVASIVE SPECIES CONTROL

Certain permit conditions, therefore a Condition of Contracts for the Prime Contractor, any Subcontractors, and any equipment or mat vendors for **National Grid Projects** shall be required to Certify their equipment⁷ {each piece of equipment used on site} as 'clean'⁸.

_____ (name of firm) hereby Certifies that
 _____ (make, model, and/or type)
 _____ (equipment ID tag or #) meets the following

1. before entry on to the job site, has been sufficiently cleaned to remove all accumulated mud, debris, plant fragments, and detritus that could harbor seeds, roots, or plant fragments of so-called invasive plant species; and
2. that the above piece of equipment has neither been off-loaded nor operated in the interval between cleaning and delivery to the jobsite.
3. that equipment deployed in areas of invasive species (as identified in project plans) shall be cleaned prior to redeployment.

_____ (signed) _____ (dated)
 _____ (printed name) _____ (title)
 _____ (Firm)

The signed original of this form {one for each piece of equipment (or lot⁹ of mats)} is to be given to the NG Construction Supervisor assigned to the project.

⁷ Equipment may include, but is not limited to bulldozers, excavators, backhoes, bucket trucks (tracked or wheeled), pulling equipment, concrete trucks, compressors, drilling equipment, and mats (composite, wood, or other materials).
⁸ With regard to invasive species, the definition of clean means free of accumulated mud, debris, plant fragments, and detritus that could harbor seeds, roots, or plant fragments of so-called invasive plant species.
⁹ Lot of mats is the number of mats that may be transported by one forwarder/truck at a time.

APPENDIX 6

SNOW DISPOSAL GUIDELINES

Finding a place to dispose of collected snow poses a challenge. While we are all aware of the threats to public safety caused by snow, collected snow that is contaminated with road salt, sand, litter, and automotive pollutants such as oil also threatens public health and the environment.

As snow melts, road salt, sand, litter, and other pollutants are transported into surface water or through the soil where they may eventually reach the groundwater. Road salt and other pollutants can contaminate water supplies and are toxic to aquatic life at certain levels. Sand washed into water bodies can create sand bars or fill in wetlands and ponds, impacting aquatic life, causing flooding, and affecting our use of these resources.

There are several steps that should be taken to minimize the impacts of snow disposal on public health and the environment.

- **DO NOT** dump snow into any water body, including rivers, the ocean, reservoirs, ponds, or wetlands. In fact, a buffer of at least 50 feet between any snow disposal area and any the high-water mark of any surface water should be kept. A silt fence or equivalent barrier should be securely placed between the snow storage area and the high-water mark. In addition to water quality impacts and flooding, snow disposed in surface waters can cause navigational hazards when it freezes into ice blocks.
- **DO NOT** dump snow within a wellhead protection area (e.g., a Zone II), in a high or medium-yield aquifer, or within 75 feet of a private well, where road salt may contaminate water supplies. **Ask an Environmental Department representative for guidance in determining if a proposed disposal area is located within one of these sensitive areas.**
- Avoid disposing of snow on top of storm drain catch basins or in storm water drainage swales or ditches. Snow combined with sand and debris may block a storm drainage system, causing localized flooding. A high volume of sand, sediment, and litter released from melting snow also may be quickly transported through the system into surface water.
- All debris in a snow storage area should be cleared from the site and properly disposed of no later than May 15 of each year the area is used for snow storage.

Under extraordinary conditions, when all land-based snow disposal options are exhausted, disposal of snow that is not obviously contaminated with road salt, sand, and other pollutants may be allowed near (within 50 feet) or even in certain water bodies under certain conditions.

In these dire situations, **notify the Environmental Department** so that the local Conservation Commission and the appropriate MassDEP Regional Service Center (in MA), RI DEM Office of Water Resources – RIPDES

Approved for use per EP 10, Document Control

Program (in RI), NH Department of Environmental Services – NHDES (in NH) and VT Department of Environmental Conservation - VT DEC (in VT) can be contacted before disposing of snow in a water body.

In emergency situations and after consulting an Environmental Department representative the following guidance should be followed:

- Dispose of snow in open water with adequate flow and mixing to prevent ice dams from forming.
- Do not dispose of snow in saltmarshes, vegetated wetlands, certified vernal pools, shellfish beds, mudflats, drinking water reservoirs and their tributaries, wellhead protection areas, or other environmentally sensitive areas.
- Do not dispose of snow where trucks may cause shoreline or stream bank damage or erosion.

1. INTRODUCTION

The purpose of this Vegetation Management Plan (VMP) is to outline the National Grid USA Electric Companies (hereafter referred to as National Grid)¹ five year plan for managing vegetation in compliance with 333 CMR 11.00 (Appendix 1).² Removing incompatible vegetation is necessary on transmission and distribution rights-of-way, and around associated structures and facilities to ensure safe, reliable delivery of electric service. Tall growing tree species must be prevented from growing into or falling onto the lines. Dense woody vegetation, vines, noxious³ (invasive plant species, nuisance and poisonous vegetation), and all vegetation that interferes with access must be removed from around structures, access roads and anywhere in which they prevent access to the rights-of-way for inspections, maintenance, repairs and in emergencies.

National Grid manages approximately 20,000 acres and 1,500 miles of rights-of-way within the Commonwealth of Massachusetts through the municipalities listed in Appendix 2. These rights-of-way extend from the western border of the Commonwealth through Worcester County, the Merrimack Valley, the North Shore, and the Southeast down through to the Attleboro area and Somerset. They traverse all types of terrain from steep mountainous topography to rolling hills and level lowlands, and from remote, relatively inaccessible locations right through high density population centers.

Taking this variety of landscape conditions into consideration, National Grid applies an Integrated Vegetation Management (IVM) approach to controlling vegetation on its rights-of-way. IVM is the utility variation of Integrated Pest Management (IPM) in which the pest is

¹ National Grid companies with rights-of-way in Massachusetts include Massachusetts Electric Company, New England Power Company and New England Hydro Transmission Electric Company.

² National Grid's VMP takes into account not only 333 CMR 11.00 and Chapter 132B, but all applicable state and federal regulations that mandate the management of utility rights-of-way including but not limited to: all pertinent clauses in Chapter 85 of the Acts of 2000; MESA; MGL c. 131 A and 321 CMR 10.00; 310 CMR 10.00 and 310 CMR 22.00; 310 CMR 40.0000; applicable Federal Energy Regulatory Commission standards including NERC Standard FAC-003-1, Commissioner Order 693, FAC-003-2 (effective July 1, 2014), and all applicable Federal Occupational Safety and Health Act, Department of Transportation and Department of Environmental Protection regulations.

³ "NOXIOUS WEED.—The term "noxious weed" means any plant or plant product that can directly or indirectly injure or cause damage to crops (including nursery stock or plant products), livestock, poultry, or other interests of agriculture, irrigation, navigation, the natural resources of the United States, the public health, or the environment." (PUBLIC LAW 106-224—JUNE 20, 2000, TITLE IV—PLANT PROTECTION ACT).

incompatible vegetation. IPM/IVM is the conscientious use of appropriate management techniques to control pests in a program designed to minimize the risk of unreasonable adverse effects on human health and the environment. National Grid's IVM program brings together a combination of treatment methods and an understanding of the variety of New England ecosystems and the built environment.

2. THE PRIMARY GOAL AND OBJECTIVES OF THE VMP

The primary goal of this VMP is to outline the standard operating procedures for vegetation management operations on National Grid's rights-of-way. Its purpose is to document National Grid's IVM Program standards, practices and procedures.

The VMP is intended to provide a basic source of information for state and municipal officials and any interested parties regarding National Grid's vegetation management program. It also provides guidance for the technicians contracted by National Grid to carry out the vegetation management treatment program.

The following items are, therefore, individual objectives that must be taken into consideration as part of the primary goal of National Grid's vegetation management program:

- To ensure the reliable delivery of electric service to our customers;
- To maintain an optimum three to five year maintenance cycle for all rights-of-way⁴;
- To ensure that vegetation management operations are conducted in a safe, effective manner and in conformity with federal and state laws, regulations, and if applicable, permit conditions;
- To treat sensitive areas listed in 333 CMR 11.04 according to regulatory and National Grid policy as areas that require special consideration during vegetation management operations;

⁴Maintenance cycles are the years between treatments.

- To allow for unplanned tasks for which all precautions are taken to utilize the correct treatment methods and to protect sensitive areas (construction, restorations, hazard tree removal, etc.);
- Following the procedures in 333 CMR 11.05(4)(d), to maintain the flexibility necessary to accommodate unique situations and the need for more appropriate techniques as they arise (in accordance with regulations, scientific advances, operational experience and/or comments from municipalities, state agencies & contractors);
- To have a National Grid representative respond quickly to any questions or complaints from the public and/or governmental agencies that relate to rights-of- way vegetation management.

3. RIGHTS-OF-WAY VEGETATION AND IDENTIFICATION OF INCOMPATIBLE TARGET VEGETATION

More compatible non-target vegetation live on electric rights-of-way than incompatible target vegetation. In fact, National Grid's rights-of-way are one of the primary remaining early successional ecological communities⁵ in New England. These low growing plant communities (compatible vegetation) help discourage the establishment of incompatible vegetation, do not hinder access and do not generally interfere with the lines. Plant species that are generally encouraged on the rights-of- way include herbaceous growth and shrubs that mature less than 12 feet in height, unless due to their location or attributes they interfere with the function of the rights-of- way. As a result, many plant and animal species use our rights-of-way as their homes, feeding grounds or nurseries. This early successional landscape, however, is not, by nature, stable; it is instead the sustained result of the IVM program established on National Grid's rights-of-way in the late 1960's.

⁵ A simplified definition of early successional ecological communities is low growing vegetation including grasses, herbaceous and shrub species and the wildlife species that inhabit them.

Vegetation that obscures the right-of-way corridors and/or grows tall enough to interfere with the lines is considered incompatible vegetation and must be removed as targets. Incompatible vegetation includes trees and limbs, tall growing shrubs, vegetation growing around substations, structures, access roads, gates, and anywhere vegetation impedes access to the rights-of-way and equipment.

Trees

The primary incompatible plant species are trees, generally defined as woody plant species that mature at heights exceeding 15 feet. Trees must be removed or controlled within the cleared width and along the edges of National Grid's rights-of-way because they are capable of growing tall enough to grow into or fall onto the lines causing electric service outages. Examples of incompatible vegetation include, but are not limited to, maples, oaks, ash, cherries, birches, beeches, spruce, hemlocks and pines.

In rare isolated instances trees may be left where the electric lines are high enough off the ground so that mature trees will not interfere with the operation of the line. Also, those species that are under the purview of the Natural Heritage and Endangered Species Program of the Massachusetts Division of Fisheries and Wildlife (NHESP) will be treated on a case by case basis.

Woody Vegetation (Non-Tree Species)

Certain categories of non-tree species are also considered incompatible vegetation, some due to their location and others because of their nature. All woody vegetation on/or encroaching upon existing roads or pathways or immediately adjacent to line structures or equipment will be controlled to provide adequate access to structures, equipment and along the rights-of-way. These include shrubs and vines, including, but are not limited to, Viburnum, Mountain Laurel, Bush Honeysuckle, Grape Vines, Virginia Creeper, etc.

Plant species that pose an environmental or safety problem will be removed whenever practical. The categories of these plant species types that cause safety problems are noxious vegetation

plant species including nuisance and poisonous plant species that have heavy thorn growth or dermal toxicity and may create hazards for people working on or traversing the right-of-way. Poisonous vegetation poses a health hazard to National Grid personnel, contractors and the public-at-large, which can lead to increased incidences of first aid and OSHA recordable incidents. Mechanical methods do not reduce the spread of these populations, particularly Poison Ivy and Poison Sumac, therefore National Grid plans to use herbicides to spot treat poisonous plants at sites under its rights-of-way identified as having a high risk of posing a health hazard.

Other types of noxious and nuisance vegetation poses a risk to the safety and health of all individuals working on or traversing a right-of-way and can further impede a rapid response in an emergency. These plants have heavy thorns, dense foliage and/or impenetrable stems; examples include, but are not limited to, federal and Massachusetts classified noxious vegetation such as Multi-floral Rose, Common & Glossy Buckthorn, and Blackberries, as well as nuisance vegetation such as Hawthorne, Greenbrier and dense populations of grapevines.

Invasive Plant Species

Noxious vegetation also includes invasive plant species that create hazards for the environment. Invasive plant species have become an increasing concern throughout Massachusetts in areas that include rights-of-way corridors where they can spread rapidly and then move into the adjacent landscape. According to the Massachusetts Invasive Plant Advisory Group, "Invasive plants" are non-native species that have spread into native or minimally managed plant systems in Massachusetts.

These plants cause economic or environmental harm by developing self-sustaining populations and becoming dominant and/or disruptive to those systems...."⁶ Some examples of invasive plant species commonly found on rights-of-way include, but are not limited to, Japanese Knotweed, Multi-flora Rose, Oriental Bittersweet and Glossy Buckthorn (some of these also fit the noxious vegetation category).

Other

If no permanent access route exists within a right-of-way, a pathway may be created during the treatment cycle and maintained in a suitable location by managing all woody vegetation within the selected route. Woody vegetation must be removed in these areas to ensure access to and within the right-of-way and line structures for safe, efficient inspection, maintenance and emergency operations. The pathway in general is no larger than 15 feet wide and the woody vegetation is either removed and/or treated with herbicides.

To ensure the accurate identification of incompatible and compatible vegetation, all vegetation management contractors are required to supply personnel familiar with the vegetation typically found growing on utility sites.

4. INTEGRATED VEGETATION MANAGEMENT AND RATIONALE FOR USE

National Grid has one of the oldest IVM programs in the Commonwealth of Massachusetts, adopting this multi-faceted approach to rights-of-way vegetation management in the late 1960's. Following the "Purpose" of 333 CMR 11.00, National Grid has, and continues to utilize, an IVM program that "...minimizes our impact on human health and the environment while allowing for the benefits to public safety provided by the selective use of herbicides."

National Grid's approach relies on reducing the amount of herbicides used by

- i. using selective herbicides/application techniques
- ii. timing applications for maximum effect
- iii. avoiding fixed application schedules
- iv. using mechanical control techniques where appropriate
- v. encouraging low growing plant communities.

These techniques are applied to individual rights-of-way on a three to five year treatment cycle when incompatible vegetation averages heights of six to ten feet and low to medium average densities.

National Grid's IVM program actually begins with understanding the concept of ecological succession. Plant life is by its nature dynamic, it is, however, governed by relatively predictable

processes of change in composition or structure known as succession. In New England, succession strives towards the climax forest, but is interrupted by natural or man-made disturbances both intentional and accidental, which can lead back to earlier stages. National Grid's goal is to encourage early successional landscapes including wetlands, vernal pools, heaths, barrens, scrub land, fields and meadows, all of which, if left alone, are dynamic; all of which dominate the landscape of utility rights-of-way under an IVM program and all of which are ideally suited to the requirements of the right-of-way. An additional benefit to this management strategy is that these early successional communities are generally populated by diverse, well-dispersed species that include many of New England's plant, animal and insect species, including many of those that are threatened or endangered.

IVM, as applied to electric utility rights-of-way, therefore is an environmentally responsible means of combining biological, chemical, and mechanical treatment methods (mowing, selective pruning, and hand-cutting) with an understanding of the stages of ecological succession and interspecies competition. The resulting right-of-way corridor is dominated by vegetation below economically damaging heights that could otherwise interfere with the delivery of electric service.

IVM has many variations, but here in New England, where the practice first began, IVM is scheduling treatment crews to target incompatible vegetation as selectively as possible and then letting early successional ecological communities help maintain compatible vegetation between treatment programs. In this interim period competition (for light, moisture, and nutrients), wildlife depredation (browsing/feeding) and other ecosystem processes inhibit the germination and growth of incompatible woody vegetation, primarily trees.⁷

⁷Yahner. "Wildlife Response to More than 50 years of Vegetation Maintenance on a Pennsylvania U.S., Right-of-Way": 123; Christopher A. Nowak & Benjamin D Ballard. "A Framework for Applying Integrated Vegetation Management on Rights-of-Way." *Journal of Arboriculture* 31(1) (January 2005): 28-37; Richard H. Yahner "State Game Lands 33 Research and Demonstration Project—57 years of Continuous Study on the Shawville to Lewiston 230-kV line of First Energy (Penelec). 2009: 9; Yahner. "2009 Annual Report to Cooperators. Green Lane Research and Demonstration Project: 23 Years of Continuous Study." (2009): 8; Yahner. "Wildlife Response to More than 50 years of Vegetation Maintenance on a Pennsylvania U.S., Right-of-Way." *Journal of Arboriculture* 30(2) (March 2004): 123 United States Environmental Protection Agency. "Fact Sheet: Integrated Vegetation Management." EPA 731-F-08-010 (Oct. 2008).

⁸National Grid recognizes that in addition to using the stages of ecological succession and interspecies competition to limit the germination and growth of incompatible vegetation, there are direct biological applications techniques. For example, the release of two leaf feeding beetles (*Galerucella calmariensis* and *G. pusilla*) can help control Purple Loosestrife (*Lythrum salicaria*). While National Grid does not rule out the potential use of these application techniques in limited areas, with approximately 20,000 acres of treatment area and the composition of our primary target species, they are not currently a significant part of our IVM program.

These biological processes or natural controls⁸ lower the dependence on chemical and mechanical controls. Inhibiting the process of plant succession, however, requires the use of all three components of IVM. All three depend upon the others in a continuous cycle that employs the unique advantages of each. Without combining all three, incompatible plant species develop increased stem densities that require more intense control measures. Combing all three, therefore lengthens the time between management cycles, reduces the amount of herbicide applied per acre and limits the need for intense mechanical controls.

Narrow one-dimensional management techniques, while frequently less expensive initially, decrease biodiversity and increase the impact of long-term vegetation management activities on the environment. For example, a mechanical only program cannot control the roots of incompatible vegetation resulting in increased stem densities of re-sprouting vegetation that grows at a rapid rate. Likewise, there are areas of a utility right-of-way that cannot be treated with herbicides

Following National Grid’s IVM approach has, over time, significantly reduced the per-acre application rate of herbicide formulations at National Grid (see Table 1).⁹ In the early stages, when herbicide applications first replaced a pure mechanical program, our rights-of-way were dominated by high stem densities of incompatible tree species. As a result, the average

⁹ National Grid Transmission Forestry Herbicide Use Summary Records.

rate per acre of applied herbicide formulations was approximately three gallons (24 pints). Around, fifteen years ago, as years of selective herbicide applications sustained a diverse desirable vegetation cover, the average rate per acre was approximately 1-1½ gallons (8-12 pints) per acre. Currently, the average rate is approximately 0.25 gallons (1-4 pints) per acre. Studies in New York have documented similar reductions in herbicide use through stable plant community management.¹⁰

National Grid will continue to monitor the use of herbicides on its rights-of-way to evaluate the trends in herbicide application rates. This work will be monitored through the use of Contractor herbicide use reports and National Grid field inventories. In addition, National Grid has recently developed a software program that contractors will begin to utilize in the field to record their herbicide use on National Grid rights-of-way.

National Grid's IVM program also recognizes and manages instances in which landscape changes prescribe the IVM techniques. Control methods are adapted or limited to suit the cultural management situation. These are areas of a right-of-way in which geologic, geographic, climactic, environmental and legal factors along with economic, agricultural, social and recreational uses of the landscape affect the application of IVM management techniques. Treatment methods are determined by soil type, moisture levels, elevation, density and growth rates; land use patterns such as golf courses, inhabited areas, Christmas tree farms, active pasture and crop lands, or where individual alternate control agreements are in place with landowners. These landscapes limit or alter the applied treatment methods. For example, in neighborhoods, incompatible plant species might not be present in yard areas but may still need to be removed from structures.

¹⁰ C.A. Nowak, C.A. and L.P. Abrahamson, "Vegetation Management on Electric Transmission Line Rights-of-Way in New York State: The Stability Approach to Reducing Herbicide Use", Proceedings of the International Conference on Forest Vegetation Management, Auburn University, April 1993.

By the selective applications and judicious use of herbicides in combination with mechanical controls and an understanding of ecological succession, National Grid's rights-of-way are meeting environmental and management goals.

Taking a multi-faceted approach minimizes the disadvantages and maximizes the benefits of each IVM component, thereby reducing the environmental impact and the financial cost of vegetation management while simultaneously increasing the overall effectiveness of the program.

5. VEGETATION MANAGEMENT AND OPERATIONAL GUIDELINES

National Grid retains independent contractors for all vegetation management treatment activities and requires that these contractors comply with all applicable state and federal laws and regulations, and National Grid vegetation management specifications. Furthermore, contractor performance and compliance with this VMP is monitored and evaluated by National Grid Foresters.

Vegetation Management Guidelines

National Grid's IVM program is applied to the full width of each right-of-way to remove or control all incompatible vegetation. Vegetation management activities must result in 100% control or removal of all incompatible target plant species greater than or equal to six feet in height and a minimum of 90% control or removal of all incompatible vegetation less than six feet in height.

With a few exceptions, all incompatible species will be removed or controlled during a treatment operation. This includes all woody vegetation and vines growing on or encroaching upon access roads, gates, or on or within ten feet of guys, poles and towers within the cleared width of the right-of-way. Treatments will also extend around the perimeter of substations following all sensitive area restrictions.

The only exceptions are trees in or edging yards, visual screens and trees or shrub species

specified by NHESP in the Priority Habitat of state-listed species. All exceptions, however, must be maintained at an acceptable height or condition that will not exceed minimum vegetation clearance distances from the lines before the next maintenance cycle.

National Grid uses two types of visual screens, shrub and tree/shrub, which screen the general public from views of structures and substations. They are maintained at sites where, in the opinion of National Grid, people may find the view of structures or substations objectionable. These sites include, but are not limited to, locations where rights-of-way cross roads, recreational areas, and inhabited areas.

Sensitive areas will be treated per 333 CMR 11.04. Vegetation management operations on such sites are designed to prevent any unreasonable adverse environmental effects. These no-spray and limited spray areas will be maintained using the appropriate control methods (see Table 1 & Appendix 7).

Conifers are generally not treated with herbicides since most species do not re-sprout. One exception to this general guideline is pine species that do re-sprout, particularly Pitch Pine, which may be treated on a limited basis with herbicides. Another exception is where White Pine regeneration has seeded in large thick carpets and mowing might be more destructive than an herbicide application.

In cases where large areas of high density incompatible species have exceeded maximum herbicide treatment heights, it may be more practical to do a mechanical treatment followed in one or two growing seasons by an herbicide treatment to obtain effective control.

Right-of-way access will be through the use of established roadways whenever possible. The contractor will obtain permission to enter a right-of-way by any other means in advance.

Unreasonable site damage or destruction during any phase of the vegetation management operation by the contractor, his agents or employees, must be repaired immediately to the satisfaction of National Grid; National Grid will determine what constitutes unreasonable site damage.

General Operational Guidelines

The National Grid Forester will inform the contractor(s) which rights-of-way will be treated, the range of treatment dates and the possible methods, materials and mixing rates. National Grid will supply treatment restrictions data, maps and written instructions outlining any special treatment considerations or instructions for each right- of-way. No work will be done until the contractor has the appropriate data, permits, restriction lists, mixing rate instructions and licensed staff.

The contractor must provide:

- Appropriately licensed or certified supervisors who understand all aspects of the contracted treatment and who are responsive to the guidance of NationalGrid;
- Supervisors who effectively manage treatment crews to ensure the satisfactory completion of the contract;
- Supervisors who effectively communicate with the public;
- Experienced and/or trained workers, who are appropriately licensed or certified;
- Workers who conduct themselves professionally at alltimes;
- The appropriate equipment maintained at the highest practical level of efficiency and effectiveness;
- Appropriately calibrated herbicide applicationequipment;
- Equipment in good visual and working condition;
- Completed paperwork.

The contractor must:

- Comply with all applicable federaland state laws and regulations;
- Have a copy of this VMP;
- Have all treatment crews carry a copy of the current Yearly Operational Plan (YOP);
- Have all treatment crews carry National Grid right-of-way maps.

In conclusion, vegetation management operations must be conducted according to this VMP and the written instructions of National Grid. Failure to do so is grounds for removal of the crew from the treatment site and termination of the vegetation management contract.

6. VEGETATION MANAGEMENT CONTROL METHODS

Mechanical and chemical controls work together to support the viability of early successional communities, therefore, National Grid utilizes a combination of hand cutting, mowing, selective pruning, selective foliar treatments, low volume basal treatments and cut stump treatments. Based on a three to five year cycle,¹¹ the treatment methods used on any given right-of-way are selected based on timing, site sensitivity, species composition and density, site access, and topography.

National Grid inspects rights-of-way for incompatible vegetation density, height and composition. A right-of-way is then scheduled for treatment when incompatible vegetation height averages six to ten feet or densities reach low to moderate levels.

These inspections are important because although treatment cycles should remain relatively consistent with the use of our IVM program, short term changes in growth conditions, site disturbances or the effectiveness of past treatments may affect the schedule on individual rights-of-way.

The advantage of a flexible IVM program is the ability to apply the appropriate treatment methods to meet the conditions of individual rights-of-way. As the sole means to control vegetation, mechanical controls are a short-term solution. With the exception of most conifer species, cut vegetation re-sprouts, resulting in significantly thicker stem densities. Selective herbicide application treatment methods effectively remove vegetation that would otherwise compete with and dominate the desired early successional ecological communities. In some areas, however, mechanical controls are the preferred method, sometimes in combination with the appropriate herbicide treatment method: on vegetation over 12 feet tall; on non-sprouting conifers (with exceptions); in no-spray sensitive areas; in visual screens; around structures; on access roads; in areas of thick, impenetrable vegetation, and where large areas of high density incompatible species exceed maximum herbicide treatment heights.

¹¹ Extending treatment cycles results in average tree heights that exceed ten feet and high densities. This requires the use of more herbicide to get proper coverage of the resulting larger tree crown area. Since the coverage is more difficult on taller trees, it increases the chance of improper coverage, off-target drift and unsatisfactory results. Deferring treatment even one year beyond their optimum treatment cycle can result in an increased herbicide use of over sixty percent (National Grid Transmission Forestry Herbicide Use Summary Records).

Mechanical Control Methods

Hand Cutting

Hand cutting is the mechanical cutting of incompatible vegetation using chain saws or brush saws, loppers or hand pruners:

- Hand cutting may be conducted at any time of the year;
- Incompatible vegetation is cut as close to the ground as practical;
- Slash from the operation is cut and scattered so as to lay as close to the ground as practical, but not exceeding two feet in height.

Hand cutting is used to protect sensitive areas; around structures, gates and access roads; to control incompatible vegetation greater than 12 feet in height; where herbicide use is prohibited by regulation or easement restriction; on non-sprouting conifer species greater than two feet in height, and on sites where terrain, site size or sensitivity renders mowing impossible or impractical.

Mowing

Mowing is the mechanical cutting of vegetation using large brush mowers mounted on rubber tired tractors or tracked vehicles:

- Mowing may be used at any time of the year except when deep snow precludes operations;
- Selection of specific equipment is based on terrain, vegetation size and equipment availability;
- Mowing is restricted by steep slopes, rocky terrain, obstructions, wet sites with deep, soft soils, and debris on the right-of-way.

Mowing is used on sites where herbicide use is prohibited by regulatory or easement restriction, where a large number of the stems of incompatible species have exceeded maximum control heights, where access is impeded by high woody vegetation density and access is required in the short term, and where terrain, site size and sensitivity permit the efficient use of the equipment.

Selective Pruning

Selective pruning is the mechanical removal of the tops or encroaching limbs of tall-growing tree species to prevent them from growing into, or falling onto, the lines:

- Selective pruning may be done at any time of the year;
- Pruning will be accomplished using aerial lifts mounted on trucks, skidders or tracked vehicles or, if terrain or obstructions prevent equipment access, by climbing crews.
- Slash will be disposed of by dicing, chipping or piling, at the discretion of National Grid:
 - Slash will not be left in waterways, trails or roads, or in such a manner that would permit it to wash into these areas;
 - The placement of cut woody vegetation must comply with applicable State Fire Marshall's regulations;
 - Slash from yards or recreational sites will be chipped or moved to an adjacent area or removed;
 - Slash will be piled in isolated areas or windrowed in parallel lines along the right-of-way in piles that should not exceed two feet in height and that do not obstruct access along or to the right-of-way;
 - Dicing will be accomplished by cutting the slash in pieces so that it lies as close to the ground as practical;
 - All slash and debris of cherry species will be removed immediately after treatment in active pastures to prevent any harm to livestock.
- Chipping is used when dicing and/or piling are prohibited or impractical:
 - Wood chips will be removed where required;
 - When left on site, wood chips will be scattered uniformly over the site at depths not exceeding four inches or piled in isolated areas;
 - No chips will be left in wetlands.

This method is used in maintaining visual screens in the limited areas where tree screens are desired and selective removals are not practical; on individual state or town regulated road crossings where it is required or practical; along the edge of rights-of-way where pruning will reduce or eliminate the threat of outages, and to provide landowners with a viable alternative

to the otherwise mandatory removal of trees for electric line maintenance and integrity that are aesthetically desirable to the property owner.

Chemical Controls

Herbicide applications include foliar, basal, cut stump surface treatments, dormant stem treatments, cut-stubble treatments, and tree growth regulators. Herbicides are applied as mixtures consisting of herbicide formulation(s), adjuvants, carriers and additives. The timing of herbicide applications, materials, and mixture rates will be listed in National Grid's YOP, twenty-one day notice letter and/or forty-eight hour newspaper notice as required under 333 CMR 11.06 and 11.07 and Chapter 85 of the Acts of 2000, Section 10 (see Appendices 1 & 4). National Grid's first choice is to use herbicides on the *Sensitive Area Materials List* administered by the Massachusetts Department of Agricultural Resources (MDAR).¹² If the situation is appropriate, National Grid, however, reserves the right to use other EPA and Massachusetts approved herbicides, following all restrictions in 333 CMR 11.04. The National Grid Forester(s) will further specify to the treatment crews the particular materials and mixture rates for individual rights-of-way according to conditions, timing of the treatment(s), the YOP and manufacturer's labels. Treatment crews will not deviate from National Grid's specifications without the approval of the Forester(s).

Individual herbicides have different levels of effectiveness on incompatible vegetation and under different conditions. No herbicide is equally effective on all plant species and certain herbicides are more effective on certain plant species than others. National Grid selects the herbicide or combination of herbicides in conjunction with the appropriate treatment method to obtain the most effective control on each right-of-way.

¹² *Sensitive Area Materials List*: <https://www.mass.gov/service-details/rights-of-way-sensitive-area-materials-list>

Individual herbicides and treatment methods also have distinctive physical effects and environmental behaviors. For example, certain herbicides or treatment methods cause foliar brownout while others do not, and certain herbicides have been formulated for use in wet environments while others have not. The selection of specific herbicides or herbicide mixtures coupled with the appropriate treatment methods is made with equal consideration given to the visual and environmental sensitivity of a right-of-way or site within a right-of-way. As a result, herbicides will not be used in certain areas if site sensitivity, regulations, restrictions, plant species composition or height recommend otherwise.

Selective Foliar Treatments

Selective foliar treatments are the application of materials to fully developed leaves, stems, needles or blades of incompatible vegetation. Selective foliar treatments are limited to the season when leaves are fully developed.

The equipment for selective foliar treatments includes: hand-pump backpack sprayers, motorized backpack sprayer and off-road vehicle mounted hydraulic sprayers. In each case, mixtures are applied as a uniform spray over the plant's entire foliage to only dampen or lightly wet the targeted vegetation, instead of being applied to the point of run-off. This minimizes the amount of herbicide drip onto desirable ground cover.

- Selective foliar treatments are used on hardwood trees and incompatible shrub species below 12 feet in height.
- In general, selective foliar treatments are not applied to conifer species; exceptions to this general guideline will be identified in National Grid's YOPs.
- Foliar treatments are also not used where landowner agreements preclude their use, within visual screens on plant species greater than six feet in height and within mechanical only sensitive areas per 333 CMR11.04.
- Foliar treatments are allowed in wetland areas where no standing water is present, per the Department of Food and Agriculture Decision, dated October, 1995, concerning the wetland impact study conducted pursuant to 333 CMR 11.04 (4)(C)(2) (Appendices 1, 5 & 6).

Low Volume Basal Treatment

Low volume basal treatments are the selective application of an herbicide, diluted in specially formulated oil, to wet the entire lower 12 to 18 inches of the main stem of incompatible vegetation. Using a hand pump backpack unit, the oil enables the herbicide solution to penetrate the bark tissue and translocate within the plant. Low volume basal treatments are extremely selective, and when used at appropriate locations are applied at very low per acre rates:

- Optimum vegetation density is low with average heights greater than four feet, within visual screens and in areas where extreme selectivity is necessary;
- This treatment method can be used any time of year except in conditions that prevent adequate access to stems;
- The optimum treatment time frame is in the dormant season when applications are easier due to the lack of foliage and the obstruction caused by grasses and herbaceous growth;
- Restrictions include when snow is too deep or in extremely wet weather;
- Basal treatments are not ideal in high stem densities because of high labor costs and increased herbicide rates per acre.

Low volume basal treatments are used with the same rationale as selective foliar treatments. Basal treatments have the advantage of extending the treatment season into the dormant season thus facilitating the retention of experienced applicators and spreading out the work load. They also have the advantage of being low profile with no noisy motorized equipment and incompatible vegetation is generally controlled without creating brownout when the treatments are completed during the dormant season.

Cut Stump Treatment

Cut stump treatments are the mechanical cutting of incompatible vegetation followed by an herbicide treatment to the phloem and cambium tissue of the stumps. The cut stump mixture is diluted in water or a non-freezing agent and is ideally applied to freshly cut stumps. Application equipment includes: low-volume backpack; hand- pump sprayers; hand

held squirt bottles; paintbrushes, and sponge applicators.

This method is used where maximum control is desirable and/or to reduce the visual impact of vegetation management treatments. It is commonly used:

- To prevent re-sprouts when hand cutting vegetation in preparation for a foliage application;
- To chemically treat incompatible vegetation in sensitive sites where other methods are not possible,
- On all woody vegetation (except non-sprouting conifers) removed from visual screen except within an environmentally sensitive area where restrictions take precedence.

Like basal treatments, cut stump treatments may be used at any time of the year provided snow depth will not prevent cutting the stumps below three inches in height. It is best to avoid during the season of high sap flow, in moderate to heavy rains, and is not practical in moderate to heavy stem densities.

Dormant Stem Treatment

Dormant stem treatment (DST) is a selective herbicide treatment applied during the late fall to early spring time period. The application technique can begin at fall leaf senescence and continue until early bud break.

The equipment for selective DST includes: hand-pump backpack sprayers, motorized backpack sprayer, and off-road vehicle mounted hydraulic sprayers. In each case, mixtures are applied as a spray over the crown to ensure the terminal and lateral buds are covered. Droplets need to cover at least 75% of the crown of the plant. DST can be used on hardwood and some softwood trees and incompatible shrub species below 8 feet in height.

Cut-Stubble Treatment

Cut stubble treatments are applied to the remaining stems left behind after a mowing operation. Following mechanical mowing and typically before woody vegetation re-sprouts, a diluted selective broadleaf herbicide mixture is applied to cut stems and soil of the treatment

area. This treatment type relies on the stems and roots of incompatible woody plants to absorb the herbicides. Herbaceous plants and grasses colonize the treatment area within months of the application.

This application may be used in areas where the wire clearance is not adequate to meet minimum standards and a conversion to grass is needed for the site. Cut stubble may be utilized any time of the year.

Tree Growth Regulators

Tree Growth Regulators (TGRs) are plant growth regulator chemicals that manage or reduce the potential growth rate of trees. This is a useful especially along certain electric lines where repetitive pruning is necessary to maintain adequate tree-wire clearances.

TGRs can lengthen the time frame between pruning cycles and improve the aesthetics of street and yard trees that may otherwise require removal or severe pruning.

TGRs can be applied in 1 of two methods:

1. basal drench around the base of the tree
2. a soil injection next to the buttress root zone

Granular Method

Granulars may be used on occasion to control brush and vines around poles and towers as part of pole maintenance to allow access to the structures. National Grid having access to its structures is necessary for inspections and to respond to maintenance and emergency needs.

Granulars are brush control herbicides that can be applied with no water or sprayer directly to the area surrounding a structure as a pre-emergent or post-emergent. The granular are applied using a calibrated handheld spreader.

Herbicide Application Restrictions and Guidelines

Herbicide application will be restricted during certain adverse weather conditions, such as rain, wind or deep snow.

Rain

Herbicide applications will not be made during periods of moderate or heavy rain fall:

- Foliar applications are effective in light mist;
- Foliar applications will cease during measurable rainfall that creates leaf runoff;
- Foliar applications interrupted by unexpected rainfall, will not resume until the rain ends and active leaf runoff has ceased;
- Basal and cut stump treatment applications are ineffective during measurable rainfall;
- Basal applications that are interrupted by rainfall will not be resumed until at least fifty percent of the application area of the targeted plants is dry.

Wind

Wind affects the individual herbicide treatment methods on different levels.

- Basal or cut stump treatments are not affected by all but the most extreme wind conditions because they are applied in such close proximity to the ground.
- During foliar applications, excessive winds can cause damage to compatible vegetation on or off the right-of-way, therefore, to prevent any significant herbicide drift, treatment crews will comply with the following restrictions:
 - During winds strong enough to bend the tops of trees' main stems on the right-of-way, the treatment crew supervisor will periodically observe the foliar application to ensure no significant movement of the herbicide mixture. If the supervisor can see the mixture moving off the targeted plants, applications will immediately stop until the wind has subsided enough to continue.
 - Following the label, all foliar application mixtures will contain anti-drift agents to reduce the potential of herbicide drift beyond the targeted plants:
 - In moderate wind conditions, as per label recommendations, more anti-drift agents may be added, at the discretion of the contractor supervisor.

Deep Snow

Herbicides will not be applied in deep snow conditions. Deep snow renders it impractical to basally apply herbicides to the lower six inches of the stems or to cut stumps below acceptable maximum height limit.

General Operational Guideline Restrictions

Disposal: The contractor is responsible for the proper disposal of all excess materials and mixtures in accordance with all applicable federal and state laws, regulations and guidelines.

Mixing: Mixing will take place according to all restrictions in 333 CMR 11.00 and according to the chemical labels.

7. JUSTIFICATION OF SELECTIVE HERBICIDE APPLICATIONS

Both regulatory and economic factors dictate the safe, reliable delivery of electric service through our transmission and distribution lines. This requirement necessitates a vegetation management program to control incompatible vegetation. Other regulations require National Grid to minimize the impact our activities have on the environment.

National Grid's IVM program allows us to stay in compliance with these various regulations, including 333 CRM 11.00, by maximizing the control of incompatible vegetation while minimizing the use of herbicides through their judicious use. Having analyzed various vegetation management methods, National Grid's chemical control methods of choice are the selective herbicide treatments described in Section 6 which in combination with mechanical and cultural treatment methods and an understanding of ecological succession, are the most sound and cost effective methods currently available.

Research has determined that when used appropriately herbicides are generally an effective method of vegetation control and can benefit public safety through selective use.¹³ The small amount of herbicide applied selectively at low rates per acre and the herbicide formulations listed in our YOP's are low in acute toxicity, are not known to bio-accumulate and, as applied, and have a short life span in the environment.¹⁴

The *Sensitive Area Material List* is an additional environmental protection tool at our disposal. This list of herbicides helps us further reduce the potential of any negative impact by limiting the herbicide formulations used in the limited spray sensitive areas defined by 333 CMR 11.04. In addition to extensive testing required by the Federal EPA before being included on the *Sensitive Area Materials List*, the impact of these herbicides on the environment are reviewed by MDAR and the Massachusetts Department of Environmental Protection.

333 CMR 11.04(4) also limits the use of herbicides around various surface waters. However, it makes an exception to the general rule for public utilities by allowing herbicide treatments within wetlands as long as sensitive area approved herbicides are not sprayed on or within ten feet of standing or flowing water. This exception is based on a study cited in the *DFA Decision Concerning The Wetland Impact Study Conducted Pursuant to 333 CMR 11.04(4)(c)(2)*. This research shows that selective herbicide applications do not adversely affect wetland plant composition or function (Appendix 5). In fact, according to the study by Environmental Consultants, Inc. quoted in the *Decision*, mechanical vegetation control techniques result in a significantly greater impact on wetland composition and function.¹⁵

¹⁵ Nickerson et al., 1993; Environmental Consultants, Inc., *Study of the Impact of Vegetation Management Technique on Wetlands for Utility Rights-of-Way in the Commonwealth of Massachusetts*, Final report prepared for New England Electric et al., 1989

The success of our selective herbicide application program in minimizing unreasonable adverse effects is evidenced by the thriving early successional ecological communities currently present on National Grid's rights-of-way, which includes the diversity and numbers of observed wildlife species taking advantages of our rights-of-way.¹⁶

Selective herbicide applications offer varied degrees of selectivity and favor, or release, certain types of plants; for example, broadleaf vegetation can be controlled with little or no impact to grasses. This diversity can only be achieved by periodically and selectively removing vigorously competitive tree species, including their root systems, which is only practical through selective herbicide application.

Selective herbicide applications minimize the amount of manpower, equipment and the impact of both on the environment compared to less selective mowing operations. For example, when used judiciously, they can be much less destructive than mowing to nesting sites and the vegetation necessary for food and cover. The resulting low growing vegetation provides a more open right-of-way with more attractive flowering plants and berries that support an increase in the diversity of wildlife species.

A selective herbicide program is also more cost effective than a purely mechanical program. The comparatively increased density and height of incompatible vegetation promoted by mechanical cutting requires the expenditure of more time and resources to control. Estimates, based on actual costs for the limited cutting currently done at National Grid, indicate that average expenditures for a mechanical cutting program are two to over five times the cost of the current IVM program. The indirect costs not factored into the estimate include lost income from reduced electric service reliability, increased time and costs for line inspections, maintenance and repair, increased insurance costs caused by higher accident rates, and the increased labor costs required to attract workers to perform this type of work.

¹⁶ Several research projects demonstrate the positive impacts of selective right-of-way vegetation management to non-target organisms (See Appendix 9).

Mechanical controls are also relatively hazardous to workers, the public and the environment. In a mowing operation, objects including rocks and pieces of wood are thrown by the mower, often long distances. Chain saws can kick back and cause injuries despite safety features and protective leg guards. Small diameter cut stumps left by cutting operations may cause trips, falls or punctured tires. Mechanical only treatment programs also facilitate the spread of injurious thorny or poisonous plants which results in unsafe conditions for the public, vegetation management and electric line crews. These plants are most practically controlled by herbicide applications due to their thick, impenetrable growth habits.

The use of mechanical equipment always includes the risk of hydraulic fluid, oil and gas spills or leaks, and chainsaw equipment releases petroleum products into the environment in the form of bar and chain oil. These mechanical operations are a necessary and integral part of National Grid's IVM program, but these hazards are an important limitation that needs to be considered as part of the overall decisions made regarding treatment options, especially when compared to the environmental and safety history of the selected herbicides.

The net benefits of including selective herbicide applications in National Grid's IVM program are tied to their role in establishing early successional ecological communities. Not only does reducing the density and inhibiting the growth of incompatible tree species reduce the actual amount of herbicides needed for vegetation control, but low-growing plant cover helps prevent the soil exposure and erosion that can result from rutting caused by mowing. Treatment cycles are lengthened and there are fewer incompatible plant species that require control which reduces both the long and short term ecological impact of vegetation management activities.

8. DEFINITION, IDENTIFICATION AND TREATMENT OF SENSITIVE AREAS

The general definition of sensitive areas regulated by 333 CMR 11.04 is as follows:

...any areas within Rights-of-Way, including No-Spray and Limited-Spray Areas, in which public health, environmental or agricultural concerns warrant special protection to further minimize risks of unreasonable adverse effects.

Protecting these environmentally sensitive sites is accomplished by defining specific sensitive areas and establishing limited spray and no-spray areas and treatment restrictions within these borders based on the sensitivity of each site and the requirement to minimize any unreasonable adverse impacts within that area.

Sensitive Areas regulated by 333 CMR 11.00 include the following:

Water Supplies:

Zone I's

Zone II's

IWPA's (Interim Wellhead Protection Areas)

Class A Surface Water Sources

Tributaries to a Class A Surface Water Source

Class B Drinking Water Intakes

Private Wells

Surface Waters:

Wetlands

Water Over Wetlands

The Mean Annual High Water Line of a River

The Outer Boundary of a Riverfront Area

Certified Vernal Pools

Cultural Sites:

Agricultural Areas

Inhabited Areas

Wildlife Areas:

Certified Vernal Pool Habitat

Priority Habitat

These sensitive areas consist of no-spray areas in which herbicide use is prohibited, limited spray areas, and areas that require special treatment recommendations (See Table 1 and Appendix 7).

TABLE 2: CONTROL STRATEGIES FOR SENSITIVE AREAS[#]

Sensitive Area	No-Spray and Limited -Spray Areas (feet)	Control Method	Restriction Code
Public Ground Water Supplies	400'	Mechanical Only	None
Primary Recharge Area	Designated no-spray area or 1/2 mile radius	Mechanical, Recommended Herbicides*	24 months
Public Surface Water Supplies (Class A & Class B)	100'	Mechanical Only	None
	100'-400'	Recommended Herbicides	24 months
Tributary to Class A Water Source, within 400' upstream of water source	100'	Mechanical Only	None
	100'-400'	Recommended Herbicides	24 months
Tributary to Class A Water Source, greater than 400' upstream of water source	10'	Mechanical Only	None
	10'-200'	Recommended Herbicides	24 months
Class B Drinking Water Intake, within 400' upstream of intake	100'	Mechanical Only	None
	100'-200'	Recommended Herbicides	24 months
Private Drinking Water Supplies	50'	Mechanical Only	None
	50'-100'	Recommended Herbicides	24 months
Surface Waters	10'	Mechanical Only	None
	10'-100'	Recommended Herbicides	12 months
Rivers	10' from mean annual high water line	Mechanical Only	None
	10'-200'	Recommended Herbicides	12 months
Wetlands	100' (treatment in wetlands permitted up to 10' of standing water) [†]	Hand Operated Equipment with 5 gal. mix capacity [†] Recommended Herbicides	24 months
Inhabited Areas	100' (for high- pressure foliar only)	Recommended Herbicides	12 months
Agricultural Area (Crops, Fruits, Pastures)	100' (for high- pressure foliar only)	Recommended Herbicides	12 months
Certified Vernal Pools	10'	Mechanical Only when water is present	None
Certified Vernal Pool Habitat	10'-outer boundary of habitat	No treatment without written approval per 321 CMR 10.14(12)	
Priority Habitat	No treatment without written approval per 321 CMR 10.14(12)		

Restrictions: "24 Months": A minimum of 24 months shall elapse between applications. "12 Months": A minimum of 12 months shall elapse between applications.

*Commonwealth of Massachusetts recommended herbicides from the *Sensitive Area Materials List*, rates and methods per 333 CMR 11.04.

[†]Per "Decision Concerning the Wetlands Impact Study" (see Appendix 5).

[#]Table Compiled by Jeffrey M. Taylor, Vegetation Control Service, Inc.

Treatment in the limited spray area requires the use of herbicides from the *Sensitive Area Materials List* and the application restrictions in 333 CMR 11.04 or in the case of Priority Habitat, approval of the YOP by NHESP.

The general characteristics of the herbicides included on the *Sensitive Area Materials List* are: low toxicity to humans and other animal species; short term soil persistence; biodegradation of active ingredients, and low soil mobility. It is National Grid's policy to primarily use the herbicides on the *Sensitive Area Materials List*, which means as a rule, in most years and/or areas, limited spray areas do not need to be identified in the field by treatment crews. Instead, they may concentrate on marking the more sensitive no-spray areas.

A current list of the *Sensitive Area Materials List* and individual *Fact Sheets* are available at: <https://www.mass.gov/service-details/rights-of-way-sensitive-area-materials-list>. The specific herbicide formulations and mixtures to be used in any given year will be listed in the YOP and the manufacturers' labels and *Fact Sheets* will be included in the appendices of the YOP.

Identification Methods

Two simple descriptions guide the complex identification of the sensitive areas defined in 333 CMR 11.04: *Readily identifiable in the field* and *Not readily identifiable in the field*.

Readily identifiable in the field areas will be treated, identified and when appropriate, marked according to all applicable restrictions listed in 333 CMR11.00.

Not readily identifiable in the field areas will likewise be treated and marked when appropriate, but they are identified by the use of data marked on maps and collected in the YOP and notification processes before the time of treatment.

The individuals assigned the task of identifying and treating sensitive areas in the field will use the appropriate sources and methods from the following list (some of which are already included in National Grid's records):

- National Grid right-of-way maps, records and institutional knowledge;
- Massachusetts Department of Environmental Protection water supply maps

- available through MassGIS;
- MDAR and Municipal Board of Health maps and lists of identified private wells along the right-of-way;
- Correspondence, meetings and input from municipalities within the forty-five day YOP and twenty-one day municipal right-of-way notification letter review and comment periods and the 48 hour newspaper notification (under 333 CMR 11.06 & 11.07 and Chapter 85 of the Acts of 2000);
- Correspondence and meetings resulting from National Grid's abutter notification procedure;
- A point person who verifies identified sensitive areas and any additional areas that may require special precautions;
- United State Geological Survey (USGS) topographical maps;
- Information from contractor's knowledge and records;
- Information from MassGIS;
- Confidential information from NHESP;
- A copy of the YOP and VMP.

The YOPs will contain maps with the most current data available at the time of printing. The maps are a resource and a tool for both the public and the vegetation management crews, therefore, they contain the data needed to identify, mark and treat sensitive areas appropriately. The maps are printed on USGS topographic maps. The most current data available through MassGIS, such as public water supplies and certified vernal pools, and any data that National Grid has collected on items such as private wells are then added on top of the USGS data. At the time of treatment, additional sensitive area information that is collected will be added to the information utilized by National Grid's vegetation management contractors.

As appropriate, sensitive areas will be identified and marked in the field by either National Grid personnel, trained and experienced vegetation management contractor personnel, and/or by individuals trained in the identification of sensitive areas.

Public and Private Drinking Water Supplies

Public and private drinking water supplies come under the *Not readily identifiable in the field* definition and deserve further discussion due to their sensitivity in relationship to the public. The appropriate sources and references listed above will be consulted to determine the location of drinking water supplies, and in accordance with 333 CMR 11.04, known drinking water supplies are marked on the YOP maps and identified in the field. In the various notification processes under 11.06 and 11.07, or at any point, we request municipalities to assist in the identification of new water supplies. Identified private drinking supplies within one hundred feet of a right-of-way are included in our permanent records and maps, and when made cognizant of new wells, these will also be identified and added to our records and maps. Landowners are also encouraged to post signs on the edge of the rights-of-way to help identify private water supplies.

The several different limited spray and no-spray areas mandated by 333 CMR 11.04(2)(a-b) for each type of water supply are included in the diagrams and table in Appendix 7. In all cases, contractors will take all measures necessary to mark and/or identify the appropriate no-spray areas for private and public drinking water supplies.

Priority Habitat of State-Listed Species

National Grid recognizes the importance of the Massachusetts Endangered Species Act, M.G.L.C. 131A, and its significance to right-of-way vegetation management and will comply with all applicable portions of this act and the regulations promulgated thereunder.

321 CMR 10.14, Massachusetts Endangered Species Act Regulations, Part II Exemptions and 333 CMR 11.04(3)(a-c) exempts utility rights-of-way vegetation management from the permit process under the following condition:

The management of vegetation within existing utility rights-of-way provided that the management is carried out in accordance with a vegetation management plan approved in writing by the Division prior to the commencement of work for which a review fee shall be charged, the amount of which shall be determined by the commissioner of administration under the provisions of M.G.L. c.7, § 3B...

To comply with this exemption, National Grid will submit this VMP and our YOPs for approval by the NHESP.

The NHESP has delineated areas as Priority Habitat based on the "Best Scientific Evidence Available" to protect state-listed species from a "take." Under the approval process, details about the Priority Habitat of state-listed species that our activities might affect and management recommendations are shared with National Grid under strict confidentiality agreements. Using this data and best management practices, National Grid and contract personnel will follow the appropriate vegetation management treatment methods within these sensitive areas taking all practical means and measures to modify right-of-way vegetation management procedures to avoid damage to state-listed species and their habitat.

To identify Priority Habitats, National Grid personnel and vegetation management crews must use proper identification procedures. Contractors are, therefore, required to train their personnel to recognize Priority Habitats using one of the following tools: training meetings, paper maps, GPS coordinates and/or GIS systems.

Provisions of 321 CMR 10.00, Part III, also allow the NHESP to designate Significant Habitat on land in the Commonwealth as a legal easement. Vegetation management activities within Significant Habitats require an Alteration Permit per 321 CMR 11.68. No such designations have been made to date, but in the eventuality that any Significant Habitats are designated on a National Grid right-of-way, we would be notified as an owner of interest. National Grid will, when it becomes necessary, seek a permit under the terms of the coordinated permit review process.

Treatment of Wetlands

Pursuant to 333 CMR 11.04 based upon the results of two right-of-way wetland impact studies, the Massachusetts Department of Food and Agriculture (now MDAR) in consultation with the Department of Environmental Protection and the Right-of-Way Advisory Panel, made a determination that herbicides, when used under the guidance of an IVM program and other conditions as set forth in the determination, have less impact on wetlands than the sole use of mechanical techniques (see Appendices 5 & 6).

Based on the *DFA Decision Concerning The Wetland Impact Study Conducted Pursuant to 333 CMR 11.04(4)(c)(2)*, incompatible vegetation will, therefore, be selectively treated following the recommendations in the *Decision* including the use of sensitive area approved herbicides and a no-spray area on or within ten feet of standing or flowing water.

9. ALTERNATE LAND USE

Most National Grid right-of-way acreage, estimated at over eighty percent, is owned by easement rights. This, in general, permits National Grid to construct, operate and maintain the electric lines, control vegetation and access the lines. The easement usually prohibits the landowner from erecting structures, inhibiting access by National Grid and its contractors, growing trees or otherwise interfering with the operation of the electric line. The property owner retains all other ownership rights and may use or restrict the use of the property on the right-of-way in any manner that conforms to the easement.

Alternative land uses that are compatible with the operation of electric utility lines are acceptable on National Grid's rights-of-way. Currently, land uses on rights-of-way include, but are not limited to, parking lots, golf courses, parks, driveways, roadways, crops, pastures, gardens, lawns and Christmas tree farms.

Sometimes landowners request that their property not be treated with herbicides. Through the easement, National Grid purchased the right to maintain vegetation on the right-of-way. National Grid utilizes the safest, most effective management program available. Generally, when the program is described to the property owner and/or the property owner observes the treatment application, their previous concerns are reduced or eliminated. If the property owner still requests that National Grid refrain from using herbicides on that property, National Grid may enter a formal agreement with that property owner. Before executing an agreement, the property owner must agree to maintain the vegetation on the right-of-way, at their expense, within National Grid's specifications. Specifications vary with each individual property, but basically require that woody vegetation be kept below a certain height and clear of access roads, gates, guys, poles and towers. National Grid's policy sets the maximum height

criteria as the smaller of 12 feet or at a height such that five years of growth will not put the tree into the line.

10. INDIVIDUALS SUPERVISING AND DEVELOPING THE IVM PROGRAM

The professional responsible for developing and submitting this plan is:

Mariclaire Rigby, Lead Vegetation Strategy Specialist
National Grid
939 Southbridge Street
Worcester MA 01610
508-860-6282

Mariclaire has a Bachelor of Science degree in Natural Resource Management-Forestry from the State University of New York College of Environmental Science and Forestry. She has worked in National Grid's Forestry Department since 2005. Mariclaire currently serves as a utility company representative on the Department of Agricultural Resources Rights-of-Way Advisory Panel, and is a member of the International Society of Arboriculture and the Utility Arborist Association. She is also an ISA Certified Arborist.

The professionals responsible for supervising this plan are:

Jonathan Duval	Eric Gemborys	Jason Magoon	Anne-Marie Moran
National Grid	National Grid	National Grid	National Grid
1250 Brayton Pt Rd	164 Viscoloid Ave	939 Southbridge St	939 Southbridge Street
Somerset, MA 02725	Leominster, MA 01453	Worcester, MA 01610	Worcester, MA 01610
(508) 730 4007	(978) 840-3816	(508) 860-6212	508-860-6925

National Grid retains qualified professionals to conceive, design, implement and supervise all phases of vegetation management operations. Vegetation management, especially herbicide application operations, requires an elevated level of technical expertise and experience to design the best integrated management approach and to adequately prescribe the proper treatments to control incompatible vegetation.

Overall supervision of the VMP and YOP's will be performed by National Grid and contract foresters. The contract foresters are responsible for guaranteeing that their field crews comply with the VMP and YOP while the National Grid foresters listed above will supervise the field implementation of the VMP and YOP.

11. REMEDIAL SPILL AND EMERGENCY PLAN

This section is offered as a general procedural guide for responding to chemical spills or related accidents (related accidents include but are not limited to fire, poisoning and vehicle accidents). National Grid contracts with independent, professional, certified herbicide applicators that are responsible for the containment, clean up and reporting of chemical spills or accidents. The following is, therefore, only a guide to the items that shall be available to the treatment crew in the event of a chemical spill or emergency:

Types of Chemical Spills that Require Action

Chemicals include, but are not limited to the following:

- | | | |
|-------------------------------------|--------------------------|--------------------------|
| i. Herbicides | <input type="checkbox"/> | Diesel Fuel |
| ii. Bar and Chain Oil | <input type="checkbox"/> | Gasoline |
| iii. Motor and Hydraulic Oil/Fluids | <input type="checkbox"/> | Title 3 Hazmat Materials |

Required Spill Response Equipment

As a minimum, the treatment crew must have available on the job site:

- | | | |
|--------------------------------------------|--------------------------|-------------------------|
| iv. YOP with Emergency Contact List | <input type="checkbox"/> | Shovel |
| v. Safety Data Sheets (SDS) | <input type="checkbox"/> | Broom |
| vi. Product Label | <input type="checkbox"/> | Flagging |
| vii. Product Fact Sheets (when applicable) | <input type="checkbox"/> | Leak Proof Container |
| viii. Appropriate Absorbent Material | <input type="checkbox"/> | Heavy-duty Plastic Bags |

Personal Contact

In the event of **Personal Contact** with hazardous chemicals:

- ix. Wash affected area with plenty of soap and water;
- x. Change clothing which has absorbed hazardous chemicals;
- xi. If necessary, contact a physician;
- xii. If necessary, contact the proper emergency services;
- xiii. If necessary, follow the procedures for Major or Minor Spills as outlined in Appendix 8;
- xiv. Avoid breathing the fumes of hazardous chemicals.

Clean-up Procedures

Education and attention will constantly be directed at accident and spill prevention,

however, in the event of an unfortunate incident, a spill response check list is included in Appendix 8 as a guide that will be included in the YOP's.

333 CMR 11.00, Rights-of-Way Regulations

333 CMR 11.00: RIGHTS OF WAY MANAGEMENT

Section

- 11.1 Purpose
- 11.2 Definitions
- 11.3 General Provisions
- 11.4 Sensitive Area Restrictions
- 11.5 Vegetation Management Plan (VMP)
- 11.6 Yearly Operational Plan (YOP)
- 11.7 Public Notification
- 11.8 Notice of Modification and Revocation
- 11.9 Right-of-Appeal
- 11.10 Penalties
- 11.11 Rights-of-Way Advisory Panel
- 11.01: Purpose

The purpose of 333 CMR 11.00 is to establish a statewide and uniform regulatory process which will minimize the uses of, and potential impacts from herbicides in rights-of-way on human health and the environment while allowing for the benefits to public safety provided by the selective use of herbicides. Specific goals of 333 CMR 11.00 are to:

1. Ensure that an Integrated Pest Management (IPM) approach to vegetation management is utilized on all rights-of-way covered by 333 CMR 11.00.
2. Establish standards, requirements and procedures necessary to prevent unreasonable risks to humans or the environment, taking into account the economic, social and environmental costs and benefits of the use of any pesticide.
3. Ensure ample opportunity for public and municipal agency input on potential impacts of herbicide application to rights-of-way in environmentally sensitive areas.
4. Establish a mechanism for public and municipal review of rights-of-way maintenance plans.

11.2 : Definitions

For the purposes of 333 CMR 11.00, unless the context clearly requires otherwise, the following definitions shall apply:

Agricultural Area includes, but is not limited to, actively cultivated gardens, greenhouses, orchards, fields, pastures, and other areas under cultivation or agricultural management.

Applicant, any person representing any federal, state or local government or agency, utility, railroad or pipeline, that intends to maintain a right-of-way in the Commonwealth by application of herbicides.

Associated Surface Water Body, as identified on the most current available maps prepared by the Department of Environmental Protection, any body of water that is hydrologically connected to a Class A surface water source.

Ballast, the coarse gravel or crushed rock on which the ties, tracks and switching, signaling and communication devices of a railroad are laid.

Broadcast, any non-selective herbicide application technique which results in application to all vegetation within a target area.

Certified Vernal Pool, a confined basin depression, certified and mapped by NHESP pursuant to the provisions of 310 CMR 10.57(2)(a)5,6, which, at least in most years, holds water for a minimum of two continuous months during the spring and/or summer, and which is free of adult fish populations.

Certified Vernal Pool Habitat, that vernal pool habitat which has been certified and mapped by NHESP pursuant to the provisions of 310 CMR 10.57(2)(a)5,6 or, in the event that such habitat has not been mapped, the area extending 100 feet horizontally outward from the boundary of any Certified Vernal Pool.

Class A Waters, waters which are designated as a source of public water supply, as defined in 314 CMR 4.05(3)(a).

Class B Drinking Water Intakes, intakes to Class B waters suitable as sources of public water supply with appropriate treatment, as defined at 314 CMR 4.05(3)(b) and as identified on the most current available maps prepared by the Department of Environmental Protection.

Department, the Department of Agricultural Resources.

FIFRA, the Federal Insecticide, Fungicide and Rodenticide Act, Public Law 92-516.

Foliar Treatment, any technique which applies herbicide to leaves of target vegetation.
Inhabited Area, any area where people generally live, work or gather, including, but not limited to, any residence, school, hospital, park or recreational facility.

Interim Wellhead Protection Area (IWPA), for public water systems using wells or well fields that lack a Department of Environmental Protection-approved Zone II, an interim wellhead protection area, as that term is defined in the Massachusetts drinking water regulations, 310 CMR 22.02, and as identified on the most current available maps prepared by the Department of Environmental Protection, shall apply. Generally, this is a ½-mile radius for sources whose approved pumping rate is 100,000 gallons per day or greater. For smaller sources, the radius in feet is determined by multiplying the approved pumping rate in gallons per minute by 32 and adding 400.

Limited Application Waiver, a waiver from the requirements of 333 CMR 11.05 and 11.06, granted at the Department's sole discretion pursuant to 333 CMR 11.03(14), when the reason for the application is emergency public health or safety or when the application is for one time only.

Limited Spray Area, any area that is both within a Right-of-Way and within:

- (a) any Zone II or IWPA
 - (b) a distance of between 100 feet and 400 feet of any Class A Surface Water Source
 - (c) a distance of between 10 and 200 feet of any tributary or associated surface water body where the tributary or associated surface water body runs outside the Zone A for the Class A surface water source
 - (d) a lateral distance of between 100 and 200 feet for 400 feet upstream, on both sides of the river, of a Class B Drinking Water Intake
 - (e) a distance of between 50 and 100 feet of any identified Private Well
 - (f) a distance of between 10 and 100 feet of any Wetlands or Water Over Wetlands
 - (g) a distance of between 10 feet from the mean annual high water line of any river and the outer boundary of the Riverfront Area
 - (h) a distance of between ten feet from any Certified Vernal Pool and the outer boundary of any Certified Vernal Pool Habitat
 - (i) a distance of 100 feet of any Agricultural or Inhabited Area.
- Low Pressure, pressure under 60 pounds per square inch (psi).

Maps, United States Geological Survey maps of scale 1:25,000 or other maps, as determined by the Department, which are of such accuracy and scale to provide sufficient detail so that sensitive areas can be delineated.

NHESP, the Natural Heritage and Endangered Species Program within the Massachusetts Division of Fisheries and Wildlife.

No-Spray Area, any area that is both within a Right-of-Way and within:

- (a) any Zone I
- (b) 100 feet of any Class A Surface Water Source
- (c) 100 feet of any tributary or associated surface water body where the tributary or associated surface water body runs within 400 feet of a Class A surface water source
- (d) 10 feet of any tributary or associated surface water body where the tributary or associated surface water body is at a distance greater than 400 feet from a Class A surface water source
- (e) a lateral distance of 100 feet for 400 feet upstream, on both sides of the river, of a Class B Drinking Water Intake
- (f) 50 feet of any identified Private Well
- (g) 10 feet of any Wetlands or Water Over Wetlands
- (h) 10 feet of the mean annual high-water line of any river
- (i) 10 feet of any Certified Vernal Pool.

Person, an individual, association, partnership, corporation, company, business organization, trust, estate, the Commonwealth or its political subdivisions, administrative agencies, public or quasi-public corporation or body, or any other

legal entity or its legal representatives, agent or assignee, or a group of persons.

Person Aggrieved, any person who, because of an act or failure to act by the Department may suffer an injury in fact which is different either in kind or magnitude from that suffered by the general public and which is within the scope of the interests identified in 333 CMR 11.00. Such person must specify in writing sufficient facts to allow the Department to determine whether or not the person is in fact aggrieved.

Private Well, any private drinking water supply identified by the local Board of Health, the well owner or the Department of Agricultural Resources.

Private Well Registry, a registry of private wells located within 100 feet of a right-of-way which is maintained by the Department of Agricultural Resources. Homeowners must notify the Department by completing a registration form which is available directly from the Department or online at the Department website.

Public Ground Water Source, a source of water for a Public Water Supply System, as that term is defined in the Massachusetts drinking water regulations at 310 CMR 22.02.

Public Water Supplier, as defined at 310 CMR 22.02(1), any person who owns or operates a public water supply system.

Right(s)-of-Way (ROW), any roadway, or thoroughfare on which public passage is made and any corridor of land over which facilities such as railroads, powerlines, pipelines, conduits, channels or communication lines or bicycle paths are located.

Rights-of-Way Advisory Panel, a panel established to advise the Department on issues relating to 333 CMR 11.00 and to fulfill specific functions as detailed within 333 CMR 11.05 and 11.11.

River, a river as defined at 310 CMR 10.04 and as identified on the most current available maps prepared by the Department of Environmental Protection.

Riverfront Area, a riverfront area as defined at 310 CMR 10.58(2) and as identified on the most current available maps prepared by the Department of Environmental Protection. In general, this term shall mean the area between the mean annual high-water line of a perennially flowing river and a parallel line 200 feet away.

Selective Application, any application of herbicides, in such a manner that the delivery to the target vegetation is optimized and delivery to non-target vegetation and the environment is minimized.

Sensitive Areas, as defined in 333 CMR 11.04, any areas within Rights-of-Way, including No-Spray and Limited-Spray Areas, in which public health, environmental or agricultural concerns warrant special protection to further minimize risks of unreasonable adverse effects.

State-listed Species, any species on the Massachusetts list of Endangered, Threatened, and Special Concern Species as described in the Massachusetts Endangered Species Act (M.G.L. c. 131A; 321 CMR 10.02).

State-listed Species Habitat, the Estimated Habitats of Rare Wildlife (310 CMR 10.59 and 10.37) and the Priority Habitats for State-listed Species (321 CMR 10.02) as shown on the most recent edition of the Massachusetts Natural Heritage Atlas prepared by NHESP.

Stem Treatment, any technique including, but not limited to, stump, basal, stem, injection, banding, frill, or girdle and any other technique which delivers herbicide at low pressure to the stump, base or stem of the target vegetation.

Surface Water Source, any lake, pond, reservoir, river, stream or impoundment designated as a public water supply in the Massachusetts Surface Water Quality Standards, 314 CMR 4.00, as identified on the most current available maps prepared by the Department of Environmental Protection.

Target Vegetation, any plant species which has the potential to interfere with the operation and safety of the right-of-way.

Touch-up Application, any limited application of herbicides following an initial treatment, which is necessary to achieve the desired vegetation control.

Tributary, as identified on the most current available maps prepared by the Department of Environmental Protection, any body of running, or intermittently running, water which moves in a definite channel, naturally or artificially created, in the ground due to a hydraulic gradient, and which ultimately flows into a Class A surface water source, as defined in 314 CMR 4.05(3)(a).

Vegetation Management Plan (VMP), a long term management plan for the applicant's right-of-way system which describes the intended program for vegetation control over a five year period.

Vernal Pool, see Certified Vernal Pool.

Water Over Wetlands, the ocean or any estuary, lake or pond as defined at 310 CMR 10.04.

Wetland(s), any of the following areas as defined in 310 CMR 10.02(1)(a), (b), (c) and (f):

- (a) Any bank, the ocean
any freshwater wetland, any estuary
any coastal wetland, any creek
any beach, bordering any river
any dune, on any stream
any flat, any pond
any marsh, or any lake
or any swamp
- (b) Land under any of the water bodies listed above
- (c) Land subject to tidal action

(f) Riverfront area.

Wetlands Determination, a written determination of the boundaries of Wetlands and boundaries of areas within 100 feet of Wetlands in accordance with the regulations of the Department of Environmental Protection (DEP) at 310 CMR 10.05(3)(a)1. and 2.. 310 CMR 10.03(6)(b) require applicants not eligible for a public utility exemption to submit these determinations with their VMPs if they will apply herbicides within 100 feet of wetlands and will not submit a Notice of Intent under M.G.L.c. 131, §40, the Wetlands Protection Act. In order to obtain a Wetlands Determination, the applicant should submit a request to the conservation commission on maps of a scale that will enable the conservation commission or Department of Environmental Protection to find and delineate the boundaries of Wetlands and buffer zones within the vicinity of the right-of-way herbicide management area. To be considered “valid”, the Wetlands Determination should be made no sooner than six months immediately prior to the submission of the Vegetation Management Plan. The Wetlands Determination shall cover the period of the Vegetation Management Plan only and shall expire at the end of the five year period of that Vegetation Management Plan.

Yearly Operational Plan (YOP), the yearly operational plan which describes the detailed vegetation management operation for the calendar year consistent with the terms of the long term Vegetation Management Plan.

Zone A, as identified on the most current available maps prepared by the Department of Environmental Protection, the protective land area for a Surface Water Source, Class A water source, Tributary, or Associated Surface Water Body defined in 310 CMR 22.02 as:

- (a) the land area between the Class A surface water source and the upper boundary of the bank;
- (b) the land area within a 400 foot lateral distance from the upper boundary of the bank of a Class A surface water source, as defined in 314 CMR 4.05(3)(a); and
- (c) the land area within a 200 foot lateral distance from the upper boundary of the bank of a Tributary or Associated Surface Water Body.

Zone I, as identified on the most current available maps prepared by the Department of Environmental Protection and as defined at 310 CMR 22.02, the protective radius required around a public water supply well or wellfield. For public water system wells with approved yields of 100,000 gallons per day (gpd) or greater, the protective radius is 400 feet. Tubular wellfields require a 250 foot protective radius. Protective radii for all other public water system wells are determined by the following equation: Zone I radius in feet = $(150 \times \log \text{ of pumping rate in gpd}) - 350$.

Zone II, as identified on the most current available maps prepared by the Department of Environmental Protection and as defined at 310 CMR 22.02, the aquifer recharge area for a public water supply well or wellfield.

11.3 : General Provisions

- (1) No person shall use an herbicide for the purpose of clearing or maintaining a right-

of-way unless appropriately certified by the Department, or licensed by the Department and working under the on-site supervision of an appropriately certified applicator.

(2) No person shall use an herbicide for the purpose of clearing or maintaining a right-of-way except in accordance with a Vegetation Management Plan (VMP) and a Yearly Operational Plan (YOP) as approved by the Department. The YOP shall be available at the work site at all times during herbicide applications and be made available to the Department and municipal officials including the Conservation Commission and Board of Health upon reasonable request.

(3) No person shall handle, mix or load an herbicide concentrate on a right-of-way within 100 feet of a sensitive area.

(4) The perimeter of any sensitive areas which are not readily identifiable on the ROW shall be identified with a clearly visible marker system, consistent with the VMP, prior to any herbicide application.

(5) No foliar application of herbicides shall be used to control vegetation greater than 12 feet in height except for side trimming.

(6) No herbicide shall be applied when the wind velocity is such that there is a high propensity to drift off target and/or during measurable precipitation, and no person shall apply herbicides in such a manner that results in drift into any No-spray Area.

(7) No person shall apply herbicides by aircraft for the purpose of clearing or maintaining a right-of-way.

(8) No touch-up applications shall be carried out except under the following conditions:

(a) Touch-up applications must occur within 12 months of the initial application.

(b) All applicable public notification procedures of M.G.L. c. 132B, § 6B, as outlined in 333 CMR 11.07(1) and (3), are followed.

(c) No more than 10% of the initially identified target vegetation on the applicant's right-of-way in any municipality may be treated and the total amount of herbicide applied in any one year shall not exceed the limits specified by the label or Yearly Operational Plan.

(d) The Department may impose such additional restrictions or conditions on the use of herbicides as it deems necessary to protect public health and the environment.

(9) The Department will maintain mailing lists of individuals and groups desiring to obtain notices on various aspects of the Program.

(10) No person shall apply any herbicide identified as a Potential Ground Water Contaminant pursuant to 333 CMR 12.00 to a right-of-way.

(11) No person shall use an herbicide for the purpose of clearing or maintaining a right-of-way unless that person has obtained the most current available map of public ground water sources from the Department of Environmental Protection.

(12) No person shall use an herbicide for the purpose of clearing or maintaining a right-of-way unless that person has done one or more of the following:

(a) obtained a current list of identified Private Wells within 100 feet of the right-of-way from the Board of Health, or

(b) obtained a current list of all private wells, within 100 feet of the right of way from the Department of Agricultural Resources private well registry; or (c) followed an alternative Private Well identification method outlined in an approved YOP.

(13) The applicator shall provide any employee of any state agency, or authority as defined in M.G.L. c. 3, § 39, when such employee is, within a right-of-way, using pesticides, supervising the use of pesticides, or present during the use of pesticides, with personal protective equipment and clothing. Applicators should note that other federal or state laws or regulations pertaining to pesticide applications may require this personal protective equipment to include protections according to Material Safety Data Sheets (MSDS's), the product label, and any other supporting technical data supplied by the manufacturer.

(14) Notwithstanding the provisions of 333 CMR 11.03(2) or other provisions of 333 CMR 11.00, the Department may, at its sole discretion, issue Limited Application Waivers to applicants wishing to apply herbicides to clear or maintain rights-of-way without VMPs or YOPs, but only under the following conditions:

(a) The applicant must demonstrate either:

1. that the application will not occur more than once in a five year period unless a VMP and a YOP are prepared and all other requirements of 333 CMR 11.00 are met; or

2. that the application is necessary to protect public health or safety.

(b) The applicant must still adhere to all public notification requirements established at 333 CMR 11.07(1) and (3).

(c) The applicant must provide the Department with a letter establishing the concurrence of the chief elected official or board of selectmen of the municipality where the application is to be made.

(d) The applicant may only use herbicides on the Department's "Herbicides Recommended for Use in Sensitive Areas List."

(e) If the application could impact Wetlands, the Department recommends that the applicant send a copy of its application for a Limited Application Waiver to the Department of Environmental Protection's Division of Wetlands and Waterways no less than 21 days before the proposed application.

(f) It should be noted that, with certain exceptions for public utilities, wetlands regulations at 310 CMR 10.03(6)(b) currently require

Wetlands Determinations prior to any application within 100 feet of a Wetland.

Limited Application Waivers shall be issued solely at the Department's discretion, and the Department may impose such additional restrictions or conditions on the use of herbicides as it deems necessary to protect public health and the environment.

11.4 : Sensitive Area Restrictions

(1) General

In any sensitive area:

(a) No more than the minimum labeled rate of herbicide for the appropriate site, pest, and application method shall be applied.

(b) Herbicides shall only be applied selectively by low pressure, using foliar techniques or basal or cut-stump applications, or other method approved for use by the Department.

(c) No person shall apply herbicides for the purpose of clearing or maintaining a right-of-way in such a manner that results in drift to any area within 10 feet of standing or flowing water in a wetland; or area within 400 feet of a public drinking water supply well; or area within 100 feet of any Class A surface water used as a public water supply; or area within 50 feet of a Private Well.

(d) Only herbicides specified by the Department as acceptable for use in sensitive areas pursuant to the Cooperative Agreement executed between the Department of Agricultural Resources and the Department of Environmental Protection on July 1-2, 1987, or future amendments thereto, shall be used in sensitive areas. Applicants proposing to use an herbicide which has been registered for use on rights-of-way but has not yet been evaluated pursuant to the provisions of the Cooperative Agreement may request that such herbicides be evaluated pursuant to said provisions. For an herbicide that has been evaluated pursuant to the provisions of the Cooperative Agreement, applicants proposing to use such herbicide in a manner inconsistent with the terms and conditions of use imposed in the guidelines may request a modification or waiver of such terms or conditions. A request for such modification or waiver shall provide a detailed rationale for use, with all relevant data including but not limited to environmental fate, efficacy and human health effects of the proposed herbicide. Such herbicides and/or uses shall be subject to the evaluation standards adopted by the Departments of Agricultural Resources and Environmental Protection in the Cooperative Agreement.

Commentary

Applicants not eligible for the public utilities exemption from the Wetlands Protection Act outlined at 310 CMR 10.03(6)(a), who wish to apply pesticides registered for use in Massachusetts to rights-of-way, may choose to apply herbicides determined to be suitable for use in sensitive areas in accordance with the provisions of the Cooperative Agreement mentioned above or, alternatively, such applicants may

proceed pursuant to the provisions of 310 CMR 10.00 as authorized by M.G.L. c. 131, § 40.

(e) The Department may impose such additional restrictions or conditions on the use of herbicides within or adjacent to sensitive areas as it determines necessary to protect human health or the environment. Such changes may be proposed by a municipal agency or individual during the public comment period.

(f) In the event of a question or dispute as to which setback applies to a sensitive area, the most restrictive setback shall apply.

(2) Water Supplies

(a) Public Ground Water Sources

1. No herbicides shall be applied within a Zone I.
2. No herbicides shall be applied within a Zone II or IWPA unless:
 - a. A minimum of 24 months has elapsed since the last application to the site; and
 - b. Herbicides are applied selectively by low pressure, using foliar techniques or basal or cut-stump applications.

(b) Class A Public Surface Water Sources, Associated Surface Water Bodies, Tributaries and Class B Drinking Water Intakes

1. No herbicides shall be applied within 100 feet of any Class A public surface water source.
2. No herbicides shall be applied within 100 feet of any tributary or associated surface water body located within the Zone A of a Class A public surface water source, or within 10 feet of any tributary or associated surface water body located outside of the Zone A of the Class A public surface water source.
3. No herbicides shall be applied within a lateral distance of 100 feet for 400 feet upstream of any Class B Drinking Water Intake.
4. No herbicides shall be applied within a distance of between 100 feet from any Class A surface water source and the outer boundary of any Zone A, or within a distance of between 10 feet and the outer boundary of the Zone A for any tributary or associated surface water body located outside of the Zone A of a Class A surface water source, or within a lateral distance of between 100 and 200 feet for 400 feet upstream of a Class B Drinking Water Intake, unless:
 - a. A minimum of 24 months has elapsed since the last application to the site; and
 - b. Herbicides are applied selectively by low pressure, using foliar techniques or basal or cut-stump applications.

(c) Private Wells

1. No herbicides shall be applied within 50 feet of an identified Private Well.
2. No herbicides shall be applied within a distance of between 50 feet and 100 feet of an identified Private Well, unless:

- a. A minimum of 24 months has elapsed since the last application to the site; and
- b. Herbicides are applied selectively by low pressure, using foliar techniques or basal or cut-stump applications.

(3) State-listed Species Habitat

(a) Any person proposing to apply an herbicide within any State-listed Species Habitat who does not have a current Yearly Operational Plan approved in writing by the Division of Fisheries and Wildlife pursuant to 321 CMR 10.14(12), shall submit all necessary materials required for review pursuant to 321 CMR 10.18.

(b) The management of vegetation within existing utility rights-of-way shall be exempt from the requirements of 321 CMR 10.18 through 10.23, provided that the management is carried out in accordance with a Yearly Operational Plan approved in writing by the Division of Fisheries and Wildlife, pursuant to 321 CMR 10.14(12).

(c) No person shall apply an herbicide within State-listed Species Habitat unless the application is approved by the Division of Fisheries and Wildlife pursuant to 333 CMR 11.04 (3a and 3b), and such approval is submitted to the Department.

(4) Wetlands, Waters Over Wetlands, Riverfront Areas, and Certified Vernal Pools

(a) No herbicide shall be applied on or within 10 feet of a Wetland or Water Over a Wetland, within 10 feet of the mean annual high-water line of any River, or within 10 feet of any Certified Vernal Pool.

(b) No herbicide shall be applied on or within a distance of between 10 feet and 100 feet of any Wetland or Water Over a Wetland, within a distance of 10 feet from the mean annual high-water line of any River and the outer boundary of any Riverfront Area, or within a distance of 10 feet from any Certified Vernal Pool and the outer boundary of any Certified Vernal Pool Habitat unless:

1. A minimum of 12 months has elapsed since the last application to the site; and
2. Herbicides are applied selectively by low pressure, using foliar techniques or basal or cut-stump applications.

(c) Notwithstanding 333 CMR 11.04(4) (a) –(b), public utilities providing electric, gas, water, telephone, telegraph and other telecommunication services (and other applicants, if consistent with all relevant provisions of the Massachusetts Wetlands Protection Act and its regulations in effect at the time of application) may apply herbicides on or within 10 feet of a Wetland in accordance with the following conditions:

1. Submission of a study, the design of which is subject to prior approval by the Departments of Agricultural Resources and Environmental Protection, evaluating impacts of the proposed vegetation management

program utilizing herbicides on or within 10 feet of Wetlands, and comparing those impacts to those which would result if only non-chemical control methods were used in these areas. The study must detail

vegetation management practices and use patterns specific to those used by the type of entity submitting the study; and

2. A finding by the Department, after consultation with the Rights-of-Way Advisory Panel, that the proposed vegetation management program utilizing herbicides on or within 10 feet of Wetlands will result in less impacts to the Wetlands than mechanical control.

3. Notwithstanding the above, no herbicides shall be applied on or within ten feet of any standing or flowing water in a Wetland.

(5) Inhabited and Agricultural Areas

No foliar herbicide shall be applied within 100 feet of any Inhabited Area or any Agricultural Area unless:

1. A minimum of 12 months has elapsed since the last application to the site; and
2. Herbicides are applied selectively by low pressure, using foliar techniques or basal or cut-stump applications.

11.5 : Vegetation Management Plan (VMP)

(1) General.

(a) Unless otherwise specified by the Department, all VMPs should be submitted by the applicant no later than September 1st prior to the calendar year of the proposed first year of maintenance. All approved VMPs shall be effective for a five year period unless otherwise modified, or revoked by the Department.

(b) The VMP shall be presented on forms and/or format approved by the Department.

(2) Requirements. The VMP shall include, but not be limited to, the following:

(a) General statement of goals and objectives of the VMP.

(b) Identification of target vegetation.

(c) Intended methods of vegetation management and rationale for use, including vegetation control techniques, equipment proposed for use, timing of applications and alternative control procedures.

(d) Discussion of justification for proposed herbicide applications, including a description of the alternative control methods considered and the reasons that they were rejected.

(e) Methods, references and sources for identifying sensitive areas and control strategies proposed for sensitive areas. Applicants should note that Department of Environmental Protection regulations at 310 CMR 10.03(6)(b) currently require Wetlands Determinations for applicants that are not eligible for a public utility exemption.

(f) Operational guidelines for applicators relative to herbicide use.

(g) Identification and qualifications of individuals developing and submitting a plan.

(h) A detailed description of the IPM Program, showing how it will minimize the amount and frequency of herbicide application.

- (i) Description of alternative land use provisions or agreements that may be established with individuals, state, federal or municipal agencies that would minimize the need for herbicides, including the rationale for accepting or denying any reasonable request made by any individual.
- (j) Description of a remedial plan to address spills and related accidents.
- (k) For state agencies and authorities as defined in M.G.L. c. 3, § 39, a description of the applicant's policy to eliminate or, if necessary, reduce the use of pesticides for any vegetation management purpose along roadways, and a demonstration that, for the proposed application, the costs of non-chemical vegetation control significantly outweigh the benefits.

(3) Public Notice, Review and Comment.

- (a) Upon receipt of the proposed VMP, the Department shall schedule and hold appropriate regional public hearings affording all interested parties the opportunity to comment, both at the hearings and in writing to the Department, on the proposed plan.
- (b) At least 21 days prior to the public hearings, the Department shall publish notice of the hearings in the Environmental Monitor and regionally located newspapers, and send notice to municipalities covered by the plan and to the appropriate mailing list. The notice will include locations where copies of the VMP can be reviewed.
- (c) The public shall have no less than 45 days, starting from publication of the Environmental Monitor notice, to comment upon proposed VMPs, unless the Department extends the comment period for good cause.
- (d) Wherever a chief elected official, Board of Health or Conservation Commission in a municipality covered by the proposed VMP requests a copy of the proposed plan, the applicant shall, at least 21 days prior to the end of the public comment period, respond to this request. The response must either include a copy of the proposed VMP, or an Internet address where the VMP may be viewed and a note that a hard copy will be provided promptly upon further request.

(4) Disposition of VMP.

- (a) 25 copies of the proposed VMP shall be submitted to the Department. The Department shall distribute copies of the proposed VMP to each member of the Rights-of-Way Advisory Panel. The Department may, at its sole discretion, allow electronic presentation of the VMP in lieu of some or all of the 25 copies that would otherwise be submitted pursuant to this subsection.
- (b) Within 30 days of the end of the public comment period unless extended for good cause, the Rights-of-Way Advisory Panel shall review the VMPs and recommend in writing to the Department approval, denial or modification of each VMP; if necessary, the Advisory Panel may request additional information from the applicant.
- (c) Within 21 days of the end of the Rights-of-Way Advisory Panel review period, unless extended by the Department for good cause, the Department will notify the applicant and the Advisory Panel in writing one of the following:

1. request for additional information or modification; or
2. denial of VMP; or
3. approval of VMP.

(d) The VMP may be modified, withdrawn or amended by the applicant through a written request sent by certified mail to the Department.

(e) Resubmission of a denied VMP, updating of a VMP, or a significant amendment to an approved VMP shall be processed according to 333 CMR 11.05.

(f) The applicant must send a copy of the approved VMP, or an Internet address where the VMP may be viewed and a note that a hard copy will be provided promptly upon further request, to the chief elected official, Board of Health, and Conservation Commission in each municipality covered by the plan.

(5) Time for Action. Non-action by the Department on a VMP within the time specified herein does not constitute approval of the submitted plan. In the event that the Department fails to notify the applicant of a decision within the time specified above and upon written request from the applicant, the Commissioner must issue a finding within ten days of receipt stating the reason for the delay and providing an estimated completion date.

11.6 : Yearly Operational Plan (YOP)

(1) General.

(a) The applicant is responsible for the accuracy and completeness of all information submitted with the YOP. The YOP shall be consistent with the objectives of the VMP and shall describe the intended operational program for that calendar year.

(b) The YOP shall be presented on forms and in a format approved by the Department.

(2) Requirements. The YOP shall include but not be limited to the following:

(a) Maps locating the rights-of-way and sensitive areas not readily identifiable in the field;

(b) Herbicides proposed including EPA Registration numbers, application rates, carriers and adjuvants;

(c) Herbicide application techniques and alternative control procedures proposed.

(d) The name, address and phone number of the company which will perform any herbicide treatment;

(e) Identification of target vegetation;

(f) The name, address and phone number of the individual representing the YOP applicant;

(g) Description of methods used to flag or otherwise designate sensitive areas on the right-of-way;

(h) Herbicide Fact Sheets as approved by the Department; and

(i) Procedures and locations for handling, mixing and loading of herbicide concentrates.

(3) Public Notice, Review and Comment.

(a) Upon submittal of the YOP for approval, the Department will publish a notice in the Environmental Monitor. Said notice shall be provided by the applicant and shall include the information on the municipalities through which the rights-of-way pass, a brief description of the intended program, and the procedure for public review and comment.

The Department shall send notification of the publication to the applicant and the appropriate mailing list.

(b) Upon submittal of the YOP to the Department, the applicant shall provide by certified mail under separate cover to the Board of Health, Conservation Commission, chief elected municipal official, and where applicable, the Massachusetts Water Resources Authority and Massachusetts Department of Conservation and Recreation, a copy of the proposed YOP (or an Internet address where the proposed YOP may be viewed and a note that a hard copy will be provided promptly upon request) and the Environmental Monitor notice for the municipality or municipalities in which the herbicide treatment is proposed. Community water suppliers shall receive electronic information or a one page notification by mail which provides details about where to receive more information. The applicant shall maintain copies of the packet sent to municipalities and certified mail receipts. The applicant shall make copies of the packet, certified mail receipts, and any further correspondence regarding hard copies of YOPs in lieu of Internet viewing, available to the Department upon request.

(c) The Department shall allow a 45-day comment period on proposed YOPs, unless extended for good cause, commencing with the publication of the notice in the Environmental Monitor and receipt of the proposed YOP and Environmental Monitor notice by each municipality.

(d) The Department may approve, deny or modify YOPs after the 45-day comment period has expired.

(4) Disposition of YOP.

(a) The applicant shall submit the YOP to the Department at least 90 days prior to the proposed commencement of application to allow completion of the comment and review period.

(b) The Department shall review the YOP to ensure that the YOP is consistent with the approved VMP. Any inconsistencies or deficiencies will be noted by the Department and returned with the YOP to the applicant.

(c) Where practical, the Department shall approve or deny the YOP within 90 days of receipt. The Department will provide notice of the decision to the applicant, municipal agencies and commentators in writing.

(d) The approved YOP in conjunction with the VMP shall govern the application of herbicide for a period not to exceed 12 months in accordance with other laws and regulations of the State and Federal governments and impose such conditions as necessary to minimize the risk of adverse effects on human health and the environment.

(5) Time for Action. Non-action by the Department on a YOP within the time specified herein does not constitute approval of the submitted plan. In the event that the Department fails to notify the applicant of a decision within the time specified above and upon a written request from the applicant, the Commissioner must issue a finding within ten days of receipt stating the reason for the delay and providing an estimated completion date.

11.7 : Public Notification

(1) At least 21 days in advance of application of herbicide to a right-of-way in any city or town, the applicant shall notify the Department, the board of health and the local public water supplier and, by registered mail, the mayor, city manager or chairman of the board of selectman, and the conservation commission in the municipality where the right-of-way lies. The notice shall include the following information: the approximate dates on which such herbicide application shall commence and conclude, provided however, that said application shall not commence more than ten days before nor conclude more than ten days after said approximate dates; the method and locations of application; a Department-approved Herbicide Fact Sheet on the active ingredient(s) of the herbicide(s) used; the EPA registration number(s) for the herbicide(s) used; the name, title, business address and phone number of the certified commercial applicator or licensed applicator, or the contractor, employer or employees responsible for carrying out the application. Where specific information required for this notice is already contained in the current YOP that is on file with the local official, the applicant may incorporate the appropriate pages of the YOP by reference in its notice to that official, indicating that these pages are also directly available from the applicant upon request.

(2) This public notice may run concurrently with the public notice and comment period in 333 CMR 11.06(3), provided that the notice is distributed at least 21 days prior to the herbicide application, and that, prior to the herbicide application, the public notice and comment period has closed and the Department has granted YOP approval without modifications. When the Department's final approval requires modifications or application dates are selected after YOP approval, separate notice under 333 CMR 11.07(a) is required.

(3) At least 48 hours prior to the application referred to in 11.07(a), the applicant must publish a conspicuous notice in at least one newspaper of general circulation in the city or town where the right-of-way lies. The notice must appear in the local section of the newspaper and measure at least four by five

inches in size. The notice shall contain the following information: the method and locations of pesticide application; the approximate dates on which the pesticide application shall commence and conclude, provided that the applications shall not commence more than ten days before nor conclude ten days after said approximate dates; a list of potential pesticides to be used; a description of the purpose of the application; and the name, title, business address and phone number of a designated contact person representing the applicant from whom any citizen may request further information. The notice should apply only to the calendar year in which the notice is published. Upon request the notice must be made available to the Department.

11.8 : Notice of Modification and Revocation

(1) The Department may suspend approval of any VMP or YOP, by written notice to the applicant and applicator, halting the application of herbicide to that right-of-way of the above mentioned YOP. After 21 days if the applicant does not request a hearing, the Department may revoke or modify the VMP and YOP, if it finds:

- (a) that the terms, conditions of restrictions thereof, are being violated or are inadequate to avoid unreasonable adverse effects on the environment or on human health; or
- (b) that the applicant has made a false or misleading statement or has not provided information requested by the Department or Rights-of-Way Advisory Panel; or
- (c) that the applicant has violated any provision of the Massachusetts Pesticide Control Act or FIFRA, or any regulations, standards, orders or license issued under either.

(2) Upon notice of revocation or modification, the applicant may modify the YOP by written request to the Department. Applications to modify the YOP shall be submitted in the manner set forth in 333 CMR 11.06 and disposed of in the manner set forth in 333 CMR 11.06. The Department may waive all or part of the requirement if it determines that the proposed changes do not significantly change the terms of the approved YOP.

11.9 : Rights of Appeal

Any person aggrieved by the decision of the Department to approve, deny, modify or revoke a VMP or YOP may request an adjudicatory hearing. The request for a hearing must be received by the Department within 21 calendar days after receipt of the decision. The request should state clearly and concisely the facts of the proceeding, the reasons the decision is alleged to be inconsistent with 333 CMR 11.00 and the relief sought by the adjudicatory hearing. The adjudicatory hearing before the Pesticide Board shall be conducted in accordance with the informal rules of adjudicatory proceeding as set forth in the regulations promulgated pursuant to M.G.L. c. 30A.

11.10: Penalties

Any person who violates any provision of 333 CMR 11.00 shall be subject to the criminal and civil penalties set forth in M.G.L. c. 132 B, § 14.

11.11: Rights-of-Way Advisory Panel

(1) A Rights-of-Way Advisory Panel shall be established to advise the Department on issues relating to 333 CMR 11.00 and to fulfill specific functions as detailed within 333 CMR 11.00.

(2) The Department shall request that the following members participate on the Rights-of-Way Advisory Panel: the Commissioners/Secretaries or his/her designee of the Department of Environmental Protection, the Department of Public Health, and the Executive Office of Transportation and Construction; and a representative of each of the following, all to be appointed by the Department Commissioner: the Massachusetts Association of Conservation Commissions, the Massachusetts Association of Health Boards, the Massachusetts Department of Conservation and Recreation, and an Environmental Advocacy Organization Representative, a member of the University of Massachusetts Extension who is well versed in weed science and Integrated Pest Management of weeds, a representative of the Massachusetts Railroad Association, a representative of a utility company, and a commercial pesticide applicator.

(3) Non-agency representatives shall remain on the panel for a term of five years. Any member absent from two or more consecutive meetings may be removed from the Advisory Panel at the discretion of the Commissioner of the Department, and a replacement requested from the representative agency, industry group, or association.

(4) The Advisory Panel shall meet at least once each year, and shall hold further meetings upon the request of the Department of Agricultural Resources or at the request of any two members of the Advisory Panel.

(5) All Advisory Panel members shall serve without compensation.

Appendix 2

List of Municipalities through which National Grid Manages Rights-of-Way

Adams	Gardner	Middleton	Shelburne
Amesbury	Georgetown	Milford	Shirley
Andover	Gill	Millbury	Shrewsbury
Ashburnham	Gloucester	Millville	Shutesbury
Athol	Grafton	Monroe	Somerset
Attleboro	Granby	Monson	Southborough
Auburn	Great Barrington	Montague	Southbridge
Ayer	Greenfield	Newbury	Spencer
Barre	Groton	Newburyport	Sterling
Belchertown	Groveland	New Salem	Stockbridge
Bellingham	Hampden	North Adams	Sturbridge
Berlin	Hancock	Northampton	Sunderland
Bernardston	Hardwick	North Andover	Sutton
Beverly	Harvard	North Attleborough	Swampscott
Billerica	Haverhill	Northborough	Swansea

Appendix 3
Chapter 132B

Statutes - Pesticides

MGL 132B Massachusetts Pesticide Control Act

Chapter 132B: Section 1. Title; purpose.

Section 1. This chapter shall be known and may be cited as the Massachusetts Pesticide Control Act.

The purpose of this chapter is to conform the laws of the commonwealth to the Federal Insecticide, Fungicide, and Rodenticide Act, Public Law 92-516, as amended, and the regulations promulgated thereunder and to establish a regulatory process in the commonwealth. The exclusive authority in regulating the labeling, distribution, sale, storage, transportation, use and application, and disposal of pesticides in the commonwealth shall be determined by this chapter.

Chapter 132B: Section 2. Definitions.

Section 2. Unless the context clearly requires otherwise, when used in this chapter, the following words and phrases shall have the following meanings:^a

"Active ingredient", in the case of a pesticide other than a plant regulator, defoliant, or desiccant, an ingredient which prevents, destroys, repels, or mitigates any pest; in the case of a plant regulator, an ingredient which through physiological action accelerates or retards the rate of growth or rate of maturation or otherwise alters the behavior of ornamental or crop plants or the products thereof; in the case of a defoliant, an ingredient which causes the leaves or foliage to drop from a plant; and, in the case of a desiccant, an ingredient which artificially accelerates the drying of plant tissue.

"Administrator", the Administrator of the United States Environmental Protection Agency.

"Adulterated", when used with reference to a pesticide, any pesticide the strength or purity of which falls below the professed standard of purity as expressed on its labeling under which it is sold; a pesticide for which any substance has been substituted wholly or in part; or a pesticide from which any valuable constituent has been wholly or in part abstracted.

"Advisory council", a council established by regulations adopted by the department for the purposes set forth in section five.

"Agricultural commodity", a plant, or part thereof, or animal or animal product produced by a person primarily for sale, consumption, propagation, or other use by man or animals.

"Animal", all vertebrate and invertebrate species, including but not limited to man and other mammals, birds, fish and shellfish.

"Certified applicator", an individual who is certified under the provisions of section ten as authorized to use or supervise the use of any pesticide which is classified by the department as being for restricted use.

"Private applicator", a certified applicator who uses or supervises the use of any pesticide which is classified by the department as being for restricted use for purposes of producing any agricultural commodity on property owned or rented by him or his employer or if applied without compensation other than trading of personal services between producers of agricultural commodities on the land of another person.

"Commercial applicator", a certified applicator, whether or not he is a private applicator with respect to some users, who uses or supervises the use of any pesticide which is classified by the department as being for restricted use for any purpose or on any land other than as provided in the preceding paragraph.

"Licensed applicator", an individual who is licensed under the provisions of section ten as authorized to be

present while pesticides classified by the department as being for restricted use are being applied under the direct supervision of a certified applicator, or to use or to be present to supervise the use or land of another for hire any pesticide classified by the department as being for general use.

"Beneficial insects", insects which, during their life cycle, are effective pollinators of plants, are parasites or predators of pests, or are otherwise beneficial.

"Board", the pesticide board, established by section three.

"Commissioner", the commissioner of food and agriculture.

"Defoliant", a substance or mixture of substances intended to cause the leaves or foliage to drop from a plant, with or without causing abscission.

"Department", the department of food and agriculture.

"Desiccant", a substance or mixture of substances intended to artificially accelerate the drying of plant tissue.

"Device", an instrument or contrivance, other than a firearm, intended to hold or dispense a pesticide and used in conjunction with a pesticide, the purpose of which is to trap, destroy, repel, or mitigate any pest or any other form of plant or animal life, other than man and other than bacteria, virus, or other micro-organism on or in living man or other living animals, but not including equipment used for the application of pesticides when sold separately therefrom.

"Director", the pesticides program director established by section four.

"Distribution" or "Distribute", to offer for sale, hold for sale, sell, barter, ship, deliver for shipment, or receive.

"Environment", includes water, air, land, and all plants and man and other living animals therein, and the interrelationships which exist among these.

"Federally registered pesticide", a pesticide which is registered pursuant to FIFRA.

"FIFRA", the Federal Insecticide, Fungicide, and Rodenticide Act, Public Law 92-516, as amended.

"Fungi" or "Fungus", non-chlorophyll-bearing thallophytes of a lower order than mosses and liver-worts, as, for example, rusts, smuts, mildews, molds, yeasts, and bacteria, except those on or in living man or other living animals, and except those in or on processed food, beverages, or pharmaceuticals.

"Imminent hazard", a situation in which the continued use of a pesticide would result in unreasonable adverse effects on the environment.

"Inert ingredient", an ingredient which is not active.

"Insect", a small invertebrate animal generally having the body more or less obviously segmented, for the most part belonging to the class insecta, comprising six-legged, usually winged forms, as for example, moths, beetles, bugs, bees, flies, and their immature stages, and to other allied classes of arthropods whose members are wingless and usually have more than six legs, as for example, spiders, mites, ticks, millipedes, and wood lice.

"Label", the written, printed, or graphic matter, on or attached to, the pesticide or device or any of its containers or wrappers.

"Labeling", all labels and all other written, printed or graphic matter accompanying the pesticide or device

at any time, or to which reference is made on the label or in literature accompanying the pesticide or device, but shall not include publications of the United States Environmental Protection Agency, the United States Department of Agriculture, or Interior, or Health, Education and Welfare, state experiment stations, state agricultural colleges, and other similar federal or state institutions or agencies authorized by law to conduct research or disseminate information in the field of pesticides, except as otherwise provided by regulation of the department.

"Land", land and water areas, including airspace, and structures, buildings, contrivances, and machinery appurtenant thereto or situated thereon, fixed or mobile.

"Licensed pesticide dealer", a person who distributes pesticides classified by the department as being for restricted use or pesticides whose uses or distribution are further restricted by regulations adopted by the department, with the approval of the board.

"Misbranded", (a) in the case of a pesticide or device, if the labeling bears any statement, design, or graphic representation relative thereto or to its ingredients which is false or misleading in any particular;

(b) in the case of a pesticide or device, if it is an imitation of, or is offered for sale under the name of, another pesticide or device;

(c) in the case of a pesticide or device, if any word, statement, or other information required by or under authority of FIFRA or this chapter to appear on the label or labeling is not prominently placed thereon with such conspicuousness, as compared with other words, statements, designs, or graphic matter in the labeling, and in such terms as to render it likely to be read and understood by the ordinary individual under customary conditions of purchase and use;

(d) in the case of a pesticide, if it is contained in a package or other container or wrapping which does not conform to standards established pursuant to FIFRA or this chapter;

e) in the case of a pesticide, if it does not contain a label bearing the registration number assigned under FIFRA to each establishment in which it was produced;

(f) in the case of a pesticide, if the labeling accompanying it does not contain directions for use which are necessary for effecting the purpose for which the product is intended and if complied with, together with any requirements imposed under FIFRA or this chapter, is adequate to protect health and the environment;

(g) in the case of a pesticide, if its label does not contain a warning or caution statement which may be necessary and if complied with, together with any requirements imposed under FIFRA or this chapter, is adequate to protect health and the environment;

(h) in the case of a pesticide, if its label does not bear an ingredient statement on that part of the immediate container, and on the outside container or wrapper of the retail package, if there be one, through which the ingredient statement on the immediate container cannot be clearly read, which is presented or displayed under customary conditions of purchase, except that a pesticide is not misbranded if the administrator has permitted the ingredient statement to be placed on another part of the container pursuant to FIFRA;

(i) in the case of a pesticide, if its labeling does not contain a statement of the use classification under which it is registered;

(j) in the case of a pesticide, if there is not affixed to its container, and to the outside container or wrapper of the retail package, if there be one, through which the required information on the immediate container cannot be clearly read, a label bearing the name and address of the producer, registrant, or person for

whom the pesticide is produced; the name, brand, or trademark under which the pesticide is distributed; the net weight or measure of the content, as required by the administrator; and the registration number assigned to the pesticide by said administrator pursuant to FIFRA;

(k) in the case of a pesticide containing any substance or substances in quantities highly toxic to man, unless the label shall bear, in addition to any other matter required by FIFRA or this chapter the skull and crossbones; the word "POISON" prominently in red on a background of distinctly contrasting color; and a statement of practical treatment, first aid or otherwise, in case of poisoning by the pesticide; and (§93) in the case of a pesticide, if its container does not bear a label, as required by the department pursuant to this chapter.

"Nematode", invertebrate animals of the phylum nemathelminthes and class nematoda, that is, unsegmented round worms with elongated, fusiform, or sac-like bodies covered with cuticle, and inhabiting soil, water, plants or plant parts. Nematodes may also be referred to as nemas or eel-worms.

"Person", an individual, association, partnership, corporation, company, business organization, trust, estate, the commonwealth or its political subdivisions, administrative agencies, public or quasi-public corporation or body, or any other legal entity or its legal representative, agent or assign, or a group of persons.

"Pest", an insect, rodent, nematode, fungus, weed, or any other form of terrestrial or aquatic plant or animal life or virus, bacterium, or other micro-organism, except viruses, bacteria or other micro-organisms on or in living man or other living animal, which is declared to be a pest by the administrator or by the department with the approval of the board.

"Pesticide", a substance or mixture of substances intended for preventing, destroying, repelling, or mitigating any pest, and any substance or mixture of substances intended for use as a plant regulator, defoliant, or desiccant; provided that the term "Pesticide" shall not include any article that is a "new animal drug" within the meaning of section 201 (w) of the Federal Food, Drug and Cosmetic Act (21 U.S.C. s 321 (w)), or that has been determined by the Secretary of the United States Department of Health, Education and Welfare not to be a new animal drug by a regulation establishing conditions of use for the article, or that is an animal feed within the meaning of section 201 (x) of such act (21 U.S.C. s 321 (x)).

"Plant regulator", a substance or mixture of substances intended, through physiological action, to accelerate or retard the rate of growth or rate of maturation, or to otherwise alter the behavior of plants or the produce thereof, but shall not include substances to the extent that they are intended as plant nutrients, trace elements, nutritional chemicals, plant inoculants, and soil amendments. Also, the term "plant regulator" shall not include any nutrient mixtures or soil amendments commonly known as vitamin-hormone horticultural products, intended for improvement, maintenance, survival, health, and propagation of plants, and as are not for pest destruction and are nontoxic, nonpoisonous in the undiluted package concentration.

"Produce", to manufacture, prepare, compound, propagate, process or repackage any pesticide or device.

"Producer", a person who manufactures, prepares, compounds, propagates, processes or repackages any pesticide or device.

"Protect health and the environment" or "protection of health and environment", protection against any unreasonable adverse effects on the environment.

"Registrant", a person who has registered any pesticide pursuant to the provisions of this chapter.

"Under the direct supervision of a certified applicator", unless otherwise prescribed by its labeling, a pesticide shall be considered to be applied under the direct supervision of a certified applicator if it is

applied by a competent person acting under the instructions and control of a certified applicator who is available if and when needed, and who is responsible for the pesticide applications made by that person, even though such certified applicator is not physically present at the time and place the pesticide is applied.

"Unreasonable adverse effects on the environment", an unreasonable risk to man or the environment, taking into account the economic, social and environmental cost and benefits of the use of any pesticide.

"Weed", a plant which grows where not wanted.

"Wildlife", vertebrate animals, excluding man, that are wild by nature, including fish, birds, mammals, reptiles and amphibians.

Chapter 132B: Section 3. Pesticide board.

Section 3. There shall be within the department of food and agriculture a pesticide board which shall consist of the commissioner of environmental protection or his designee, the commissioner of food and agriculture or his designee, the director of the division of food and drugs or his designee, the commissioner of fisheries, wildlife and recreational vehicles or his designee, the commissioner of environmental management or his designee, the commissioner of public health or his designee, and seven persons appointed by the governor one of whom shall have been engaged in the commercial production of a plant-related agricultural commodity for at least the preceding five years on land owned or rented by him, one of whom shall have been an active commercial applicator of pesticides for at least the preceding five years, one of whom shall have expertise in the health effects of pesticide use, one of whom shall be a physician, one of whom shall be experienced in the conservation and protection of the environment, and two of whom shall represent the public at large. The commissioner of food and agriculture or his designee shall be chairman of the board.

The appointive members of the board shall receive fifty dollars for each day or portion thereof spent in the discharge of their official duties and shall be reimbursed for their necessary expenses incurred in the discharge of their official duties. Each appointive member shall be appointed for a term of four years, except for persons appointed to fill vacancies who shall serve for the unexpired term. Any member shall be eligible for reappointment.

The board shall hold an annual meeting in March, and regularly at three other times annually, and from time to time at the call of the chairman or upon the request of any two members.

Seven members of the board shall constitute a quorum. The board may, by vote of a majority of its members then in office, adopt rules and regulations for the conduct of its business. Rules and regulations adopted may be amended or repealed by a two-thirds vote of its members.

The board in addition to other powers conferred in this chapter shall advise the commissioner of food and agriculture with respect to the implementation and administration of this chapter.

The pesticides program director established by section four shall attend meetings of the board, shall serve as secretary thereto, but shall have no vote in its deliberation.

Chapter 132B: Section 3A. Pesticide board subcommittee.

Section 3A. A subcommittee of the pesticide board shall be established and shall be charged with the responsibility of registering all pesticides for use in the commonwealth pursuant to section seven. Said subcommittee shall also be responsible for issuing all experimental use permits pursuant to section eight. Said subcommittee shall consist of five members, the director of the division of food and drugs, who shall act as chairman, the commissioner of the department of food and agriculture or his designee, the commissioner of the department of environmental management or his designee, the commissioner of public health or his designee, and one person appointed by the governor, who shall have been actively engaged in commercial application of pesticides for at least the preceding five years who shall be a

member of the pesticide board. Any person aggrieved by the decision of said subcommittee may appeal any such decision according to the provisions of section thirteen.

Chapter 132B: Section 4. Programs director.

Section 4. The pesticide regulatory functions conferred upon the department under the provisions of this chapter shall be under the administrative supervision of a pesticide programs director who shall be qualified by training and experience to perform such duties. Said director shall be appointed by the commissioner with the approval of the board for a term of five years. Said person shall be eligible for reappointment, but may be removed by the commissioner for cause. The position of director shall not be subject to the provisions of chapter thirty-one or the provisions of section nine A of chapter thirty. If an employee serving in a position which is classified under chapter thirty-one or in which he has tenure by reason of section nine A of chapter thirty shall be appointed director, he shall upon termination of his service as director be restored to the position which he held immediately prior to such appointment or to a position equivalent thereto in salary grade in the same state department; provided, however, that his service in such unclassified position shall be determined by the civil service commission in administering chapter thirty-one. Such restoration shall be made without impairment of his civil service status or tenure under section nine A of chapter thirty and without loss of seniority, retirement, or other rights to which uninterrupted service in such prior position would have entitled him. During the period of such appointment, the person so appointed from a position in the classified service shall be eligible to take any competitive promotional examination for which he would otherwise have been eligible.

Chapter 132B: Section 5. Powers and duties of department.

Section 5. The department with the approval of the board may cooperate and enter into cooperative agreements and contracts with appropriate federal agencies, the agencies of other states, interstate agencies, other agencies of the commonwealth or its political subdivisions, or private or nonprofit organizations in matters related to the purposes of this chapter or FIFRA, and may receive from and dispense to such agencies such funds as may be available for the purposes of this chapter and FIFRA.

The department with the approval of the board shall take all action necessary or appropriate to secure for the commonwealth the benefits of FIFRA and other pertinent federal legislation.

The department with the approval of the board and subject to the provisions of chapter thirty A may from time to time adopt, amend or repeal such forms, regulations and standards as it deems necessary for the implementation and administration of this chapter.

The department with the approval of the board shall by regulation establish and formulate procedures whereby the advice or relevant advisory councils shall be sought incident to the development of policy or the adoption, amendment or repeal of regulations related to the administration of this chapter.

The department may with the approval of the board declare such pests and devices as it deems necessary to be subject to the provisions of this chapter.

Chapter 132B: Section 6. Prohibited distributions, etc.

Section 6. No person shall distribute a pesticide not registered pursuant to the provisions of section seven. This prohibition shall not apply to the transfer of a pesticide from one plant or warehouse to another plant or warehouse and used solely at such plant or warehouse as a constituent part to make a pesticide which is or will be registered pursuant to the provisions of this act; or the distribution of a pesticide pursuant to the provisions of an experimental use permit issued under section eight.

No person shall distribute a pesticide classified by the department as being for restricted use to a person not appropriately certified to use that pesticide. This prohibition shall not apply to the distribution of a pesticide to a competent individual acting under the direct supervision of an individual appropriately certified to use that pesticide.

No person shall distribute a pesticide that is adulterated or misbranded or a device that is misbranded.

No person shall distribute any pesticide unless it is in the registrant's or the producer's unbroken, unopened, and sealed container. This prohibition shall not apply to the repackaging of pesticides because of damage in transit.

No person shall distribute any pesticide that does not conform to any requirement of its registration or permit.

No person shall distribute any pesticide in containers that are unsafe due to damage or design.

No person shall detach, alter, deface, or destroy, wholly or in part, any label or labeling provided for in this chapter or in regulations adopted thereunder, or to add any substance to, or take any substance from, a pesticide in a manner that may defeat the purposes of this chapter or regulations adopted thereunder.

No person shall distribute, handle, dispose of, discard, or store any pesticide or pesticide container in such a manner as to cause injury to humans, vegetation, crops, livestock, wildlife, beneficial insects, to cause damage to the environment, or to pollute or contaminate any water supply, waterway, groundwater or waterbody.

No person shall act in the capacity of, or advertise as, or assume to act as a licensed pesticide dealer unless that person is in possession of a currently valid license issued by the department pursuant to the provisions of section nine. No person possessing a pesticide dealer license shall violate or allow to be violated any term, condition, restriction or provision of said license.

No person shall purchase or use a pesticide that is not registered by the department under the provisions of section seven; provided, however, that this prohibition shall not apply to the use of a pesticide consistent with the terms of an experimental use permit issued by the department under the provisions of section eight.

Chapter 132B: Section 6A. Prohibited activities.

Section 6A. No person shall use a registered pesticide in a manner that is inconsistent with its labeling or other restrictions imposed by the department. No person shall use a pesticide which is the subject of an experimental use permit inconsistently with the terms and conditions of said permit.

No individual certified or licensed as a pesticide applicator shall violate any provision, condition, term or restriction of his certification or license.

No person shall use a pesticide that has been classified by the department as being for restricted use unless he is an appropriately certified private applicator, an appropriately certified commercial applicator, or a competent individual acting under the direct supervision of an appropriately certified applicator.

Chapter 132B: Section 6B. Herbicides; application by utilities; notice.

Section 6B. No gas, electric, telephone or other utility company licensed to do business in the commonwealth shall spray, release, deposit, or apply any herbicide to any land which it owns or as to which it holds an easement or similar right and over which it maintains power, high tension or other lines without first notifying, by registered mail, the mayor, city manager or chairman of the board of selectmen and the conservation commission in the city or town where such land lies twenty-one days prior to such spraying.

The notice shall contain the following information: the approximate dates on which such spraying shall commence and conclude; provided, however, that said spraying shall not commence more than ten days prior nor conclude more than ten days after said approximate dates; the type of herbicide to be used and a copy of all information supplied by the manufacturers thereof to the utility relative thereto; the name and address of the contractor who will make the application for the utility or the name, title and business

address of the employee who will be responsible for carrying out the application if it is to be made by utility company employees.

Chapter 132B: Section 7. Registration.

Section 7. Pesticides, including pesticides that are federally registered may be registered by the subcommittee of the pesticide board for use in the commonwealth.

Each applicant for the registration of a pesticide shall annually file with the subcommittee an application providing thereon such information as said subcommittee shall require. Said subcommittee may require of applicants for pesticide registrations any information that it deems necessary to determine whether, or how, the pesticide should be registered.

An applicant desiring to register or reregister a pesticide shall pay such registration fee, not to exceed twenty-five dollars, as said subcommittee may by regulation require. All pesticide registrations shall be for a period not to exceed one year.

In the event that any person files with said subcommittee an application to reregister a pesticide which is registered on the date of application for reregistration and pays the appropriate fee therewith, such registration shall be deemed to be in effect until the earlier of the following two events shall occur, ninety days have elapsed after the registration was scheduled to expire, or the subcommittee notifies the applicant for reregistration that the registration has been renewed, modified or denied.

If said subcommittee determines that a pesticide, when used in accordance with its directions for use, warnings and cautions and for the uses for which it is registered, or for one or more such uses, or in accordance with a widespread and commonly recognized practice, will not generally cause unreasonable adverse effects on the environment, it may classify the pesticide, or the particular use or uses of the pesticide to which the determination applies, as being for general use.

If said subcommittee determines that a pesticide, when used in accordance with its directions for use, warnings and cautions and for the use for which it is registered, or for one or more of such uses, or in accordance with a widespread and commonly recognized practice, may cause, without additional restrictions, unreasonable adverse effects on the environment, including injury to the applicator, it may classify the pesticide or the particular use or uses to which the determination applies, for restricted use.

Said subcommittee shall register a pesticide if it determines that its composition is such as to warrant the proposed claims for it; its labeling and other material required to be submitted comply with the requirements of this chapter; it will perform its intended function without unreasonable adverse effects on the environment; and when used in accordance with widespread and commonly recognized practice it will not generally cause unreasonable adverse effects on the environment.

As part of the registration of a pesticide, said subcommittee may require that the pesticide be colored or discolored if such requirement is necessary for the protection of health or the environment, may classify for restricted use any pesticide or pesticide use classified for general use under FIFRA, and may include in the registration such conditions of use as it deems necessary.

If at any time it appears that a pesticide registration does not comply with the provisions of FIFRA, this chapter, or rules and regulations promulgated thereunder, or when used as registered, or a pesticide may cause unreasonable adverse effects on the environment, or a registered pesticide is an imminent hazard, the subcommittee as established in section three A, may, forthwith by an order suspend the registration of such pesticide. Notification of such order shall be sent to the applicant and shall be a public record.

Chapter 132B: Section 8. Experimental use permits.

Section 8. Any person may apply to the subcommittee for an experimental use permit for a pesticide. Each applicant for an experimental use permit shall file with the department an application providing thereon such information as the department may require. Each applicant for an

experimental use permit shall pay such registration fee, not to exceed twenty-five dollars, as the department may by regulation require.

The subcommittee may grant an experimental use permit to an applicant therefor if it determines that the applicant needs such a permit to accumulate information necessary to register a pesticide.

The subcommittee shall refuse to grant an experimental use permit if it believes that the pesticide applications to be made under the proposed terms and conditions may cause unreasonable adverse effects on the environment, or if it believes that the applicant or person to conduct the experimentation is not competent to conduct such experimentation without causing unreasonable adverse effects on the environment.

The subcommittee shall revoke any experimental use permit, at any time, if it believes that its terms or conditions are being violated, or that its terms and conditions are inadequate to avoid unreasonable effects on the environment.

Chapter 132B: Section 9. Dealers' licenses.

Section 9. A person may apply to the department to be a licensed pesticide dealer. Said applicants shall submit to the department a statement supplying such information thereon as the department may require. An applicant for such a license shall pay such registration fee, not to exceed twenty-five dollars, as the department may by regulation require, for each principal distribution center, branch outlet, or direct sales representative of an out-of-state distributor.

In the event that any person files with the department an application to renew a pesticide dealer's license which is in effect on the date of application for renewal and pays the appropriate fee therewith, such license shall be deemed to be in effect until the earlier of the following two events shall occur: ninety days have elapsed after the license was scheduled to expire; or the department notifies the applicant for renewal that the license has been renewed, modified or denied.

The department shall grant a pesticide dealer's license for a term not to exceed one year. The department shall grant such licenses subject to such terms, conditions and restrictions as it deems necessary or appropriate.

The department shall refuse to grant a pesticide dealer's license if it finds that the proposed distributor or his agent has acted in a manner inconsistent with the purposes for requirements of this chapter or FIFRA.

The department shall revoke any pesticide dealer's license, at any time, if it finds that its terms, conditions or restrictions are being violated or are inadequate to avoid unreasonable adverse effects on the environment.

As part of its determination to refuse to grant, or to revoke, a pesticide dealer's license the department may specify a period, not to exceed two years, within which the applicant may not reapply for a pesticide dealer's license. In the event that the department has specified a period for nonapplication, the department may later, at its discretion, shorten or waive such period.

Chapter 132B: Section 10. Certificates and licenses; issuance, suspension and revocation.

Section 10. Certifications and licenses to use pesticides may be issued to individuals by the department in accordance with the provisions, standards and procedures contained in and established pursuant to this chapter. Each certification and license issued pursuant to this section shall be valid only for the individual to whom it is issued, may not be transferred, and shall not continue in force and effect after the death of the individual to whom it is issued. All certifications and licenses shall be for a period not to exceed one year, unless sooner revoked or suspended.

The department may authorize individuals to use pesticides in classifications as a certified commercial applicator, a certified private applicator, and a licensed applicator provided, however, that the department shall require that all persons who are applicators of pesticides in public and private places used for

human occupation and habitation, except residential properties with three or less dwelling units, shall be so licensed or certified with such special designation.

The department may establish such categories and subcategories as it deems necessary to restrict or condition the scope of pesticide use permitted within each classification. The department may establish such standards and criteria, take such action and impose such requirements as it deems necessary to determine or redetermine levels of competence and experience to qualify for each classification and each category and subcategory thereof.

Each applicant for a certification or license shall annually file with the department an application providing thereon such information as the department may require.

Each applicant desiring to be certified or licensed shall annually pay such application fee, not to exceed twenty dollars, as the department may by regulation require.

In the event that any individual files with the department an application to renew a certification or license which is in effect on the date of the application for renewal and pays the appropriate fee therewith, such certification or license shall be deemed to be in effect until the earlier of the following two events shall occur: ninety days have elapsed after the certification or license was scheduled to expire; or the department notifies the applicant that the certification or license has been renewed, modified or denied.

The department may issue a certification or license to an applicant therefor if it determines that the applicant satisfies the criteria established for that certification or license and the category or subcategory for which the certification or license is sought. The department may thus issue a certification or license subject to such terms, conditions, restrictions and requirements as it deems necessary. The department may require that an applicant for a certification or license has obtained and maintains in effect a contract of liability insurance conforming to regulations established by the department.

The department shall prior to issuing a certificate or license evaluate each applicant to determine his competence with respect to the use and handling of pesticides, or to the use and handling of the pesticides or class of pesticides covered or to be covered by said individual's certification or license. Said evaluation shall include such examinations as the department may require. Examinations may be taken only upon payment of a fee, not to exceed ten dollars for each examination given, as the department may require by regulation approved by the board.

The department may revoke, suspend, cancel or deny any certification or license, or any class thereof, at any time, if it believes: that the terms or conditions thereof are being violated or are inadequate to avoid unreasonable adverse effects on the environment, or that the holder of or applicant for the certification or license has violated any provision of this chapter or FIFRA or any regulation, standard, order, license, certification or permit issued thereunder or that the holder or applicant for said certification or license is not competent with respect to the use and handling of pesticides, or to the use and handling of the pesticides or class of pesticides covered by said individual's certification or license. Any person whose certification or license is suspended or revoked hereunder shall also be subject to such other punishment, penalties, sanctions or liabilities as may be provided by law. As part of its determination to refuse to grant, to revoke, or to suspend a certification or license the department may specify a period, not to exceed two years, within which the applicant may not reapply for a certification or license. In the event that the department has refused to issue or has revoked or suspended such a certification or license, and has specified a period for non-application, the department may later, at its discretion, shorten or waive such period.

The department may, at its discretion, appropriately license or certify any person possessing a valid certification or license, or equivalent rating, issued by the pesticide control agency of any other state or the federal government whose standards for the issuance of such rating are not less stringent than those of the department, provided that the pesticide control agency of that state extends similar privileges to persons so licensed or certified by the commonwealth. Any person so licensed or certified shall be subject to the annual fee requirements of this section.

Chapter 132B: Section 11. Protection of health and environment; regulations.

Section 11. The department shall by regulation establish such restrictions and prohibitions upon the disposal and storage of pesticides, packages and containers of pesticides, and materials used in the testing or application of pesticides as it deems necessary to protect health and the environment.

Chapter 132B: Section 12. Departmental orders; hazards; adverse environmental effects; violations.

Section 12. Whenever it appears to the department that there is an imminent hazard, or a potential threat of unreasonable adverse effect on the environment, or a violation or a potential violation of any provision of this chapter or of any license, certification, permit, order, registration or regulation issued or adopted thereunder, the department may issue to such persons as it deems necessary an order requiring the production of samples and records, or an order imposing restraints on or requiring such action, as it deems necessary. Issuance of an order under this section shall not preclude and shall not be deemed an election to forego any action to recover for damages to interests of the commonwealth or, under section fourteen of this act, for civil penalties or for criminal fines and penalties.

Chapter 132B: Section 13. Adjudicatory hearings.

Section 13. Any person aggrieved by a determination by the department to register or not to register a pesticide, to suspend a pesticide registration, to issue, not issue or revoke an experimental use permit, to issue, deny, revoke or suspend any certification or license, or to issue an order, made under the provisions of this chapter, may request an adjudicatory hearing before the board under the provisions of chapter thirty A. Said determination shall contain a notice of a right to request a hearing and may specify a time limit, not to exceed twenty-one days, within which said persons may request a hearing before the board under the provisions of said chapter thirty A. If no such request is timely made, the determination shall be deemed assented to. If a timely request is received, the board shall within a reasonable time hold a hearing and comply with the provisions of said chapter thirty A. In hearings so held the board shall designate a hearing officer to preside over the hearing, to assemble an official record thereof, and to render a tentative decision as provided in paragraph (7) of section eleven of said chapter thirty A. The board shall make the final decision on the basis of the official record and tentative decision so rendered.

If, in making a determination which under the provisions of the preceding paragraph may be the subject of an adjudicatory hearing, the department finds that an imminent hazard or an unreasonable adverse effect on the environment could result pending the conclusion of the adjudicatory hearing requested thereon, the department may order that the determination shall become provisionally effective and enforceable immediately upon issuance, and shall remain so notwithstanding and until the conclusion of any adjudicatory hearing procedures timely requested. In the event that the department has thus made a determination provisionally effective, it may later, at its discretion, shorten the duration of or waive such order.

As part of a final decision in an adjudicatory proceeding held under the provisions of this section, the board may specify a reasonable time period within which the matter may be barred from further proceedings before the department or the board. In the event that the board has so specified a time period, the board may later, at its discretion, shorten or waive such period.

A person aggrieved by a final adjudicatory determination of the board may obtain judicial review thereof pursuant to the provisions of chapter thirty A.

Chapter 132B: Section 14. Violations; penalties; injunctions.

Section 14. Any person who knowingly violates any provision of section six shall be punished by a fine of not more than twenty-five thousand dollars, or by imprisonment for not more than one year, or both such fine and imprisonment, for each such violation, or shall be subject to a civil penalty not to exceed twenty-five thousand dollars for each such violation, which may be assessed in an action brought on behalf of the commonwealth in any court of competent jurisdiction. Each day of violation shall constitute a separate offense.

Any person who violates any provision of section six A or six B or who violates any regulation adopted under the provisions of this chapter, (a) shall be punished by a fine of not more than one thousand dollars, or imprisonment for not more than six months, or both such fine and imprisonment, for the second and each subsequent offense knowingly committed, or (b), shall be subject to a civil penalty not to exceed ten thousand dollars for any offense, which may be assessed in an action brought on behalf of the commonwealth in any court of competent jurisdiction. Each day of violation shall constitute a separate offense.

Any person who violates any order issued under the provisions of this chapter, (a) shall be punished by a fine of not more than twenty-five thousand dollars or imprisonment for not more than two years, or both such fine and imprisonment, for each violation knowingly committed, or (b) shall be subject to a civil penalty not to exceed twenty-five thousand dollars for each violation, which may be assessed in an action brought on behalf of the commonwealth in any court of competent jurisdiction. Each day of violation shall constitute a separate offense.

The superior court shall have jurisdiction to enjoin violations of, or grant such relief as it deems necessary or appropriate to secure compliance with, any provision of this chapter or the terms of an order, license, certification, registration, permit or regulation issued or adopted thereunder.

Chapter 132B: Section 15. Departmental personnel, agents and inspectors; powers; evidence; confidential information.

Section 15. For the purpose of administering the provisions of this chapter, personnel or agents of the department and its inspectors shall have access and entry at reasonable times to any premises pursuant to a search warrant duly issued by a court of competent jurisdiction, provided that no sample of a pesticide obtained in the course of such inspection and no result of any analysis or test of any such sample shall be received in evidence in any criminal proceeding under this chapter unless the sample shall have been taken and the analysis or test conducted by a chemist in the agricultural extension service of the University of Massachusetts authorized by the department. Personnel or agents of the department may take such samples as are reasonably necessary to accomplish the purpose of their investigation and inspection. Any information relating to secret processes, methods of manufacture, production or use obtained in the course of such inspection shall be kept confidential upon request, when not required to be disclosed incident to the enforcement of this chapter. This section shall not be construed to abrogate any of the powers and duties, as defined by general or special law or common law, of any agency or political subdivision of the commonwealth.

Appendix 4

Chapter 85, Section 10

CHAPTER 85 OF THE ACTS OF 2000

SECTION 10.

Said chapter 132B is hereby further amended by striking out section 6B, as appearing in the 1998 Official Edition, and inserting in place thereof the following section:

Section 6B.

- a. No gas, electric, telephone or other utility company licensed to do business in the commonwealth, nor any agency of the commonwealth or any of its political subdivisions, nor any authority, as defined in section 39 of chapter 3, nor any private entity or their agent, shall spray, release, deposit or apply any pesticide to any land which it owns, or as to which it holds an easement or similar right and over which it maintains power, high tension or other lines, or to any roadway, railway, or other transportation layout, without first notifying the department and, by registered mail, the mayor, city manager or chair of the board of selectmen and the conservation commission in the city or town where such application is to occur 21 days before such spraying, release, deposit or application, and without first publishing conspicuous notice in at least one newspaper of general circulation in each city or town where such land lies at least 48 hours prior to such spraying, release, deposit or application. Such notice shall appear in the local section of the newspaper and measure at least four by five inches in size. The published notice shall include: the method and locations of pesticide spraying, release, deposit or application; the approximate dates on which spraying, release, deposit or application shall commence and conclude, but such spraying, release, deposit or application shall not commence more than ten days before nor conclude more than ten days after such approximate dates; a list of potential pesticides to be used; a description of the purpose of the spraying, release, deposit or application; and the name, title, business address and phone number of a designated contact person from whom any citizen may request further information.
- b. The notice to the city or town where the affected land lies shall contain the following information: the method and locations of pesticide spraying, release, deposit or application; the approximate dates on which such spraying, release, deposit or application shall commence and conclude, but such spraying, release, deposit or application shall not commence more than ten days before nor conclude more than ten days after such approximate dates; the type of pesticide to be used and a copy of all information supplied by the manufacturers thereof relative to the pesticide; a department-approved fact sheet and United States Environmental Protection Agency registration number for each pesticide; the name, title, business address and phone number of the certified commercial applicator, certified private applicator or licensed applicator, or the contractor, employers or employees responsible for carrying out the pesticide spraying, release, deposit or application.
- c. Notwithstanding any other provision of law, all agencies of the commonwealth and all authorities, as defined in section 39 of chapter 3, shall develop policies to eliminate or, if necessary, reduce the use of pesticides for any vegetation management purpose along any roadway.
- d. Any employee of any state agency, or authority, as defined in section 39 of chapter 3, when spraying, releasing, depositing or applying pesticides, supervising the use of pesticides, or when present during the spraying, release, deposit or application of pesticides, shall be provided with personal protection equipment and clothing in conformance with all federal and state laws and regulations pertaining to pesticide applications. This shall include, but not necessarily be limited to, protections according to Material Safety Data Sheets (MSDS), the product label, and any other supportive technical data provided by the manufacturer.

**PUBLIC UTILITY VEGETATION
MANAGEMENT PROGRAM FINDING**

Background

The Rights of Way Management (ROW) Regulations (333 CMR 11:00) promulgated in 1987 prohibit the use of herbicides to control vegetation along utility right of ways on or within ten (10) feet of a wetland unless the following conditions are met:

1. Submission of a study, the design of which is subject to prior review and approval of the Departments of Food and Agriculture and Environmental Protection, evaluating impacts of proposed vegetation management programs on wetlands; and
2. A finding by the Department, after consultation with the Advisory Committee, that the proposed vegetation management program will result in less impacts to the wetland than mechanical control.
3. Notwithstanding the above, no herbicides shall be applied on or within ten feet of any standing or flowing water in a wetland.

On April 28, 1988, The Departments of Food and Agriculture and Environmental Protection approved the scope of the study. In the fall of 1989, Environmental Consultants, Inc. submitted to the Department of Food and Agriculture the study entitled, "Study of the Impacts of Vegetation Management Techniques on Wetlands for Utility Rights-of Way in the Commonwealth of Massachusetts", dated June 1989. The Department consulted with the Vegetation Management Plan (VMP) Advisory panel at their November 15, 1989, December 7, 1989 and August 1, 1991 meetings.

The study provided some broad information of vegetation control along utility right of ways. The Department based its finding solely upon the narrow scope of whether the "proposed vegetation management program will result in less impacts to the wetland than mechanical control."

The following are the major evaluation points the Department considered in reaching its decision.

What are the Long-term and Short-term Impacts From Herbicide use and Mechanical Control?

Since wetlands are not a static, unchanging resource, there is some difficulty in determining the actual long-term impacts from the various vegetation control practices. The extent of wetland alterations must be the most important factor in determining impacts. With limited or selective removal of unwanted plant species in specific locations, it appears that long-term impacts are negligible. While mowing or foliar application can damage non-target species, neither control practice appears to result in adverse long-term impacts if they are carefully executed. Clear cutting, however, has a greater impact on wetlands since both wanted and nuisance species are removed.

Although there were some reservations about the sites that were chosen to determine the level of chemical residues, the study did show that there was not a buildup of background residues of herbicides applied from previous practices. However, there were some trace amounts of petroleum products - bar oil or hydraulic fluid found. The source of these petroleum products is unclear and may have been the result of public activities not related to vegetation management. Retrospective analyses for herbicide residues in previously treated wetland areas is not generally applicable since the herbicides used today are less persistent than those which were used previously. However, these analyses did indicate that the herbicides used in the past do not persist in the environment.

The study clearly demonstrated that adjacent non-controlled wetland areas did not differ significantly in composition and abundance of plant species from the controlled areas. The control practices did not appear to impact the entire wetland ecosystem, since a long-term comparison of wetland plant species composition between controlled and non-controlled sites did not differ significantly. Therefore, the long-term effects on the entire wetland ecosystem were considered negligible.

The determination of the short-term impacts to the wetland from the control practices was the most noted short-coming of the study. However, this was not part of the original scope. The VMP Advisory Panel felt, and the Department agreed, that a short-term environmental fate study would be needed.

The first study indicated that certain mechanical control practices can impact wetlands and disrupt the ecosystem to a greater extent than the judicious use of herbicides. While cutting may result in re sprouting of some unwanted vegetation in a manner unlikely to be encountered in unaltered wetland areas, unregulated mechanical vegetation control could result in the destruction of other non-target plant species.

What is the Impact to Non-target Wetland Plant Communities?

Basal and cut stump treatment with low mobility, short persistence herbicides that are judiciously applied usually do not impact adjacent plant species. Likewise careful selective mechanical cutting (versus mowing or clear cutting) also usually does not impact non-target wetland plants. The greatest potential risk to non-target wetland plants comes from mowing, clear-cutting, and high volume foliar applications. Low volume foliar applications in wetlands may also cause non-target impacts if application guidelines are not followed (e.g. no applications during high winds, or without using anti-drift agents, etc.).

Is There Enough Information on Which to Base a Finding?

As in most environmental assessments, a complete database is not available to answer all of the questions posed by the Department and the Vegetation Management Advisory Panel. Some of the questions posed were entirely valid, but were beyond the scope of the approved study.

The study did provide some clear evidence that selective mechanical and herbicide use does minimally alter wetlands by removing specific plant species. Mechanical mowing operations, however, can result in far greater short-term and potentially long-term impacts to wetlands since both wanted and un-wanted plant species are indiscriminately removed. Additionally, foliar herbicide applications may cause short-term impacts to non-target species.

The Department did not find any significant difference in wetland impacts between careful mechanical removal (selective hand cutting) of unwanted species

and, cut stump or basal treatment with herbicides.

There is no assurance that prohibiting the use of herbicides in wetlands will result in careful mechanical control. If herbicide use is prohibited in wetland areas, mechanical control in wetlands will be the only practice available to utilities. Financial pressures and other considerations may force Utilities to increase mowing and / or the use of more destructive non-chemical control practices due to a lack of alternative control techniques.

On August 29, 1991, the Department made a finding that the submitted study met the approved scope. However, although the study contained useful information, it was also determined that additional data needed to be gathered and analyzed because the study was inconclusive in a number of instances.

The Department issued a finding that a proposed vegetation program containing the specific elements listed does not pose an unreasonable adverse impact to wetlands. In addition, the Department required a study be conducted to provide important environmental fate data necessary for the long-term implementation of the rights of way program.

AUGUST 1991 FINDING

The Department of Food and Agriculture finds that a proposed vegetation program containing the following elements will not pose an unreasonable adverse impact to wetlands:

1. *The Integrated pest Management (IPM) system, as described in the Vegetation Management Plan and Yearly Operation Plan, is utilized in wetland areas. The IPM system must, at a minimum, place emphasis on encouraging low growth plant species to discourage unwanted vegetation and, minimizing the frequency and amount of herbicide use by only controlling specific non-conifer tree species which will impact transmission line operation and access to the right of way.*
2. *Herbicides may be applied by basal, cut stump or low volume foliar methods. Foliar applications must include the use of drift reduction agents. Foliar applications may only be conducted in situations where basal and cut stump treatments are not appropriate based on the size of the vegetation and potential for off-target drift. Foliar applications must not result*

in the off-target drift to non-target species.

3. *Herbicides are not applied to conifer species (pine, spruce, fir, cedar and hemlock).*
4. *Carriers for herbicides do not contain any of the following petroleum based products: jet fuel, kerosene or fuel oil. Carriers will be subjected to review by the Department of Food and Agriculture and DEP through 333 CMR 11.04(1)(d).*
5. *Herbicides must be recommended by the Department of Food and Agriculture and DEP through 333 CMR 11.04(1)(d).*
6. *Herbicides may only be applied by hand operated equipment containing no more than 5 gallons of diluent.*
7. *All other restrictions within sensitive areas remain in effect. In accordance with 333 CMR 11.04(1)(c), no person shall apply herbicides for the purposes of clearing or maintaining a right-of-way in such a manner that results in drift to any areas within 10 feet of standing or flowing water in a wetland or area within 400 feet of a public drinking water supply well; or area within 100 feet of any surface water used as a public water supply; or area within 50 feet of a private drinking water supply identified under 333 CMR 11.04(2)(c)(3).*
8. *Approved Vegetation Management Plans and Yearly Operation Plans must be amended as needed to reflect the conditions of this FINDING.*
9. *The Department further requires that environmental fate data be provided by the utilities that are applying herbicides to rights-of-way, which characterizes the movement of herbicides applied to wetland areas under these conditions. The Department further requires that all study protocols be reviewed by the Vegetation Advisory Panel and be approved by the Department of Food and Agriculture and the Department of Environmental Protection. Failure to submit the required information by the dates outlined in the schedule below will render this finding void.*

An approvable scope of the study developed and

submitted by January 1, 1992.

Field data submitted to DFA by October 1, 1992. Data must be consistent with the requirements of the approved scope.

Draft study report submitted to DFA by October 1, 1993.

Final Report submitted to DFA by March 1, 1994.

10. *The Department reserves the right to amend or withdraw its FINDING at anytime if it determines that the use of herbicides in wetland areas poses a greater impact than mechanical control or may pose an unreasonable adverse effect to humans or the environment.*
11. *This finding expires December 31, 1994.*

Therefore, herbicide use may be allowed to control certain vegetation along utility right of ways if the proposed vegetation program as described in the approved Vegetation Management Plan and Yearly Operational Plans contains the above elements.

On, April 27, 1992, the Departments of Food and Agriculture and Environmental Protection approved the scope of the "*Study of Fates of Herbicides in Wetlands on Electric Utility Rights of Way in the Massachusetts Over the Short Term*". The final report was submitted to the Department of Food and Agriculture December 31, 1993. The Department began reviewing the report in consultation with the VMP Advisory panel.

At the end of 1994, the Department had not completed its review. Therefore, on December 22, 1994 the Department extended the current finding for one year (to December 31, 1995) or until such time it is able to make a final determination, whichever occurs first.

Fates of Herbicides Over the Short Term Study

The objective of this study was to determine the short term environmental fate and assess the impacts of selected herbicides applied by four common Right-of-Way management techniques. Additionally, the study evaluated which of the four Right-of-Way management techniques provides the most effective control of target vegetation and which techniques produced the least impact on the non-target plant community, and consequently the least alteration of wooded wetland community.

The study investigated the environmental fate of two herbicides, which are typically used to control vegetation on ROWs, and are included in the list recommended for use in sensitive areas. These herbicides were chosen, among other reasons, for their use patterns, size of area treated, and application rates. Accord, which contains the active ingredient glyphosate, is the primary herbicide used for cut stump treatment and is also used for foliar application. Garlon 4, which contains the active ingredient triclopyr, is the primary herbicide used for basal applications. Collectively these products represent the typical herbicides used to control vegetation on ROWs.

Results

A summary of the most important findings and conclusions of the study include:

* Based upon the samples collected immediately after application, at 1 week, 1 month, 3 months and 1 year:

- The two herbicides, glyphosate and triclopyr degrade rapidly. Residues reach low quantities quickly, often less than detection limits, within a year.; and
- There is essentially no movement either laterally or vertically from the treated sites by glyphosate. Triclopyr does not move laterally, but was noted to move vertically in small amounts.

* Drift cards indicate that the herbicides are neither splashed nor carried any distance by the wind. Glyphosate drift is not a significant problem resulting in slight effects on neighboring vegetation and are not detectable in the next year's growth. Sphagnum moss next to trunks treated basally with triclopyr were killed within three months in a 15 cm diameter circle immediately around the target tree, but the dead circle did not continue to enlarge.

* Filter paper recovered immediately after application of herbicide showed that all methods of application deposit herbicide on the ground. Treated bare soil samples showed as consistent a drop in herbicide concentrations and as little vertical movement as did samples beneath target trees.

* The use of the herbicides glyphosate and triclopyr at the strengths and application rates used does not pose a risk of accumulation in organically rich soils.

* Herbicide concentrations in soil continue to decline as time advances.

* Rainfall occurring more than a week after application does not appear to spread the herbicide nor does groundwater carry any substantial fraction of what has been applied to a particular site down into the soil or horizontally.

* Based upon the results of the study, an assessment of the environmental fate, and observations of both treatment effectiveness and non-target impacts, an effective and environmentally sensitive ranking from most effective and posing least potential environmental risks to least effective and posing the most environmental risk is suggested:

1. Most effective control and exclusive effect on target:
low-volume foliar (with glyphosate).
2. Most consistent control with lethal effects on bordering vegetation:
high-volume foliar (with glyphosate)
3. Total control with rings of dead vegetation around treated trunks:
low-volume basal (with triclopyr)
4. Incomplete target control and leaving largest soil residues:
cut-stump (with glyphosate)

It is important to note that the results of the second short term study suggest that the most efficacious application techniques and which pose the lowest environmental risk were not those recommended in the interim finding.

DEPARTMENT DETERMINATION

Based upon the results of the two ROW impact studies, the general information in the literature, and after consultations with the Vegetation Management Panel, the Department finds that the following proposed vegetation management program will result in less impacts to wetlands than exclusive use of mechanical control methods. Therefore, the Department finds that any vegetation management program that incorporates the conditions under which the study was conducted as well as taking into account the results of previous studies, will result in the least impacts to wetlands.

These conditions include:

1. An Integrated Pest Management (IPM) system, also known as Integrated Vegetation Management (IVM), as described in the Vegetation Management Plan and Yearly Operation Plan is utilized in wetland areas. The IPM system must, at a minimum, place emphasis on encouraging low growth plant species to discourage unwanted vegetation and, minimizing the frequency and amount of herbicide use by only controlling specific non-conifer tree species which will impact transmission line operation and access to the right of way.
2. Herbicides may be applied by low volume foliar, basal, or cut stump methods. Foliar applications must include the use of appropriate drift reduction agents, and must not result in the off-target drift to non-target species. Basal and cut-stump treatments may be conducted in those situations where the size of the vegetation, potential for off-target drift, or other considerations precludes the use of low-volume foliar applications. Cut stump and basal applications shall be restricted, when practicable, to periods when static ground water levels are low or otherwise when conditions are less susceptible to potential contamination.
3. Herbicides are not applied to conifer species (pine, spruce, fir, cedar and hemlock).
4. Carriers for herbicides do not contain any of the following petroleum based products: jet fuel, kerosene or fuel oil. Carriers will be subjected to review by the Department of Food and Agriculture and DEP through 333 CMR 11.04(1)(d).

5. Only herbicides recommended by the Departments of Food and Agriculture and Environmental Protection through 333 CMR 11.04(1)(d) may be used in sensitive areas.
6. Herbicides may only be applied by hand operated equipment containing no more than 5 gallons of diluent.
7. All other restrictions within sensitive areas remain in effect. In accordance with 333 CMR 11.04(1)(c), no person shall apply herbicides for the purposes of clearing or maintaining a right-of-way in such a manner that results in drift to any areas within 10 feet of standing or flowing water in a wetland or area within 400 feet of a public drinking water supply well; or area within 100 feet of any surface water used as a public water supply; or area within 50 feet of a private drinking water supply identified under 333 CMR 11.04(2)(c)(3).
8. A minimum of twelve months must elapse between herbicide treatments. Only touch-up applications may be performed between twelve and twenty four months.
9. Approved Vegetation Management Plans and Yearly Operation Plans must be amended as needed to reflect the conditions of this determination.

.....

Therefore, herbicide use may be allowed to control certain vegetation along utility right of ways if the proposed vegetation program as described in the approved Vegetation Management Plan and Yearly Operational Plans contains the above elements.

Preface to 310 CMR 10.00

310 CMR: DEPARTMENT OF ENVIRONMENTAL
PROTECTION PREFACE TO WETLANDS REGULATIONS RELATIVE TO
RIGHTS OF WAY
MANAGEMENT 1987 REGULATORY REVISION

In 1983, the Massachusetts Pesticide Control Act, M.G.L. c. 132B, was amended to require notification of conservation commissions prior to application of herbicides on rights of way. Many commissions became aware for the first time that application of herbicides on rights of way may result in alteration of wetlands and, with the exception of exempt utilities, may require action under the

M.G.L. c. 131, § 40. On July 18, 1986, the Department issued a final decision after adjudicatory hearing in DEP Hearing Docket Nos. 83-28 and 83-35 (Clinton and Leverett) finding that the application of specific herbicides by the railroads to track and ballast within 100 feet of wetland areas would alter those wetlands and was therefore subject to jurisdiction under M.G.L. c. 131, § 40, requiring the filing of Notices of Intent with the local conservation commissions.

The Department of Food and Agriculture (DFA) initiated a Generic Environmental Impact Report (GEIR) evaluating alternatives for rights of way management. A technical advisory task force of environmentalists, agencies and rights of way managers assisted in the GEIR preparation and, based on results of the study, recommended to the Secretary of Environmental Affairs a framework for a coherent state-wide rights of way regulatory program. DFA published draft regulations to implement this program in 1986 and received extensive public commentary. Final regulations, 333 CMR 11.00, became effective on July 10, 1987.

The DFA regulations require persons proposing to apply herbicides to rights of way to first receive approval of a five year Vegetation Management Plan (VMP) and Yearly Operating Plan (YOP). These regulations identify certain "sensitive areas", including wetlands and public and private surface and groundwater supplies, where the application of herbicides is, in most instances, prohibited, and areas adjacent to the sensitive areas where use of herbicides is curtailed.

DEP worked closely with DFA to include provisions which give maximum protection for water supplies and provide protection for wetlands at least equal to that provided under the M.G.L. c. 131, § 40 and 310 CMR 10.00. To eliminate duplicate review under M.G.L. c. 131, § 40, DEP has adopted changes to the wetlands regulations which allow herbicide applications on rights of way in accordance with the DFA regulations without filing a Notice of Intent under the M.G.L. c. 131, § 40. However, non-exempt applicants will still be required to file a Request for Determination of Applicability to the appropriate conservation commission to establish boundaries of wetlands on or near the right of way. Specifically, these regulations presume that work performed in accordance with a VMP and YOP, as may be required under DFA regulations, will not alter an area subject to protection under M.G.L. c. 131, § 40.

During the public comment period on its proposed regulations, the Department identified several issues of major concern. After consideration of all comments, the Department has determined that, except for minor points of clarification and the addition of an automatic expiration date, no further changes in the regulations are warranted at this time. A discussion of these issues follows.

A. Presumption vs. Limited Project. Several commentators suggested that conservation commissions should retain the authority to review each herbicide application on rights of way through the usual Notice of Intent process. These regulations create a presumption that herbicide application carried out in accordance with an approved VMP and YOP under the DFA regulations will not alter wetlands and that the filing of a Notice of Intent is therefore not required. This procedure was established pursuant to the recommendation of the GEIR task force which states:

The regulations which provide for approval of Vegetation Management Plans by the Department of Food and Agriculture should be conditioned on review and approval by the Department of Environmental Protection (DEP) of those portions of the Plans that deal with wetlands. The DEP should be required to certify to the DFA that these portions of the Plans will result in compliance with the substantive and procedural provisions which protect the interests of the M.G.L. c. 131, § 40. If the regulations are so drawn, activities under a Plan approved by DEP would not constitute an alteration of wetlands as defined under 310 CMR 10.00.

Since the DFA regulations provide that DEP is a member of the VMP advisory panel which reviews and makes recommendations on the approval of VMPs, the GEIR task force recommendations have been fully implemented. Therefore, the Department has determined that it would be duplicative to require the filing of individual Notices of Intent in each municipality for each application of herbicides to rights of way.

B. Adequacy of Setback from Wetlands. The DFA rights of way regulations prohibit application of herbicides on or within ten feet of wetlands and strictly limit herbicide application from ten feet to 100 feet of wetlands. Many commentators questioned the adequacy of these setback requirements and suggested that a 50 or 100 foot no spray zone would be more appropriate. Several commentators suggested that the proposed setback requirements were inconsistent with the Department's adjudicatory hearing decision in the Clinton and Leverett cases.

The no spray zone surrounding wetlands is necessary for three reasons: to compensate for mapping errors, to compensate for applicator errors and to assure that herbicides will not migrate into wetlands after application on the adjacent uplands. During the public comment period, the Department received no evidence demonstrating that the ten-foot setback established in the DFA regulations will not be adequate. The DFA regulations establish a procedure for selecting a limited number of herbicides that may be applied in the limited spray zone (from 10 to 100 feet from wetlands) which is adjacent to the no spray zone. Herbicides that will be selected for use in these limited spray zones under the DFA regulations are those which available data demonstrate will not migrate further than ten feet.

The applicators have argued that they can maintain a level of accuracy in mapping of wetlands and in application of herbicides to assure that herbicides will not be inadvertently applied within ten feet of wetland areas. The Department is not convinced that these claims are unreasonable; however, in order to confirm their accuracy, the Department has included in the final regulations an automatic expiration date two years from the effective date, which is coterminous with the expiration date of the DFA regulations. During the two-year effective period of these regulations, the Department expects applicators to conduct studies monitoring

herbicide application operations and to submit a report concerning impacts of herbicide application on wetlands under these new regulations detailing the accuracy of wetlands mapping, the accuracy of herbicide application, and the extent of herbicide migration. The results of this study will provide a basis for recommendations by the Department for amendments to the DFA regulations and a decision on reauthorization of these amendments to the Department's wetland regulations.

Finally, the Department does not find the setbacks requirements established in the DFA regulations to be inconsistent with its decision in the Clinton and Leverett cases. In that decision, the Department assumed a worst-case analysis in terms of an herbicide known to be highly mobile which was applied to the track and ballast areas adjacent to wetlands. The Department found, based on the particular facts of these cases and the particular herbicide proposed for application that there would be a migration of that herbicide into the wetlands from application within the 100-foot buffer zone that would be sufficiently concentrated to cause alterations of the wetlands plants. However, the DFA rights of way management regulations set up a procedure for identification of herbicides which are relatively immobile and which are preapproved for application on the buffer zone in order to avoid alteration of wetlands plants. Furthermore, guidelines for application of the selected herbicides will also be established. Finally, no herbicides may be applied within ten feet of wetland areas. In light of the strict controls placed on application of herbicides within the 100-foot buffer zone under the DFA regulations, the Department finds that adoptions of the proposed regulatory scheme is fully consistent with its previous adjudicatory hearing decision in the Clinton and Leverett cases.

C. Impacts of Herbicides Application on Wildlife Habitat. The Department is currently developing regulations under M.G.L. c. 131, § 40 to protect wildlife habitat, The effective date of these regulations is November 1, 1987. One commentator expressed concern regarding the impact of herbicide application on wildlife habitat in wetlands, and particularly on the habitat of rare, "state-listed" wildlife species. As discussed above, the Department has determined that the DFA regulations provide for protection of wetlands from alterations due to herbicide application. However, the DFA regulations do not include flood plains in their definition of wetlands, although those regulations do prohibit herbicide application within 10 feet of any standing or flowing surface water. Beyond that, there is no specific protection of wildlife habitat, including rare species, in floodplain areas.

The Department is concerned that the DFA regulations do not specifically address protection of wildlife habitat in floodplains, in particular those rare, "state-listed" wildlife species. Therefore, as a member of the VMP advisory panel, the Department will review VMPs for potential effect on wildlife habitat and specifically will recommend disapproval of any VMP that will have an adverse effect in areas mapped by the Natural Heritage and Endangered Species Program as habitat of any rare, "state-listed" wildlife species. Furthermore, the Department expects applicators to incorporate into the previously discussed two-year monitoring study a section detailing the effects of herbicide application on wildlife habitat in floodplains and on the habitat of rare, "state-listed" wildlife species. The Department will use the results of this study as the basis for recommending any amendments to the DFA regulations and a decision on reauthorization of these amendments to the Department's wetlands regulations.

Appendix 7

Sensitive Areas: Illustrations of No-Spray and Limited Spray Areas

Vegetation Control Strategies in Sensitive Areas

Required by 333 CMR 11.00 and/or approved Vegetation Management Program and Yearly Operational Plan.

Sensitive areas not readily identified in the field:

- Mapped on electronic USGS Topographic Maps.
- Contractor will be provided electronic and hard copy of maps with which to flag the boundaries of no-spray areas within the right-of-way (ROW) prior to herbicide application.

Public Ground Water Supply Well Zone I

Drinking Water Intake Class B

Public Surface Water Source Class A

Identified Private Drinking Water Well

Sensitive areas readily identifiable in the field:

- Consult USGS Topographic Maps
- Contractor will be provided electronic and hard copy of maps with which to flag the boundaries of no-spray areas within the right -of-way (ROW) prior to herbicide application.
- Contractor will mark additional areas not found on maps

Wetlands

Defined by Chapter 131,
Section 40

Surface Waters and Rivers

All surface water and water over wetlands.
Mean high water for rivers.

Agricultural Areas

Active - Growing Season

Inactive Agricultural

No Restrictions

Sensitive areas readily identifiable in the field: continued

- Consult USGS Topographic Maps
- Contractor will be provided electronic and hard copy of maps with which to flag the boundaries of no-spray areas within the right-of-way (ROW) prior to herbicide application.
- Contractor will mark additional areas not found on maps

Inhabited Areas

Where people live, work, or gather

Road Crossings

Foliar spray of resprout permitted. National Grid policy

KEY

	= No Herbicide Use			= Limited Herbicide Use
	= Water	1.) Herbicide recommended for use in sensitive area: per (333 CMR 11.04(1)(d)).		
	= Public Ground Water Supply Well or Private Well	2.) Cut stump, basal and <u>low</u> pressure foliar.		
		3.)  24 months elapsed since previous treatment.		
		 12 months elapsed since previous treatment.		
		4.)  No herbicides applied to conifer species and carriers reviewed by DAR and DEP.		
		5.)  Cut stump only.		
		6.)  Cut stump and basal treatments. (Foliar application to resprouts is permitted.) No other conditions.		

Appendix 8

Remedial Plan to Address Spills Form

REPORTABLE SPILLS

(Spills of reportable quantity of material per 310 CMR 40.0000):

FOLLOW STEPS 1-11

NON-REPORTABLE SPILLS:

FOLLOW STEPS 1-4, 7-11 as appropriate & contact the National Grid representative.

Order	ACTION	Done (√)
1	Use any and all PPE as directed by product label or SDS.	
2	Cordon-off spill area to unauthorized people and traffic to reduce the spread and exposure of the spill	
3	Identify source of spill and apply corrective action, if possible stop or limit any additional amounts of spilled product.	
4	Contain spill and confine the spread by damming or diking with soil, clay or other absorbent materials.	
5	Report spills of "reportable quantity" to the Mass. DEP and MDAR:	
	MDAR, Pesticide Bureau	(617) 626-1700
	Massachusetts Department of Environmental Protection, Emergency Response Section (call within 2 hours)	Main Office (24 Hours): (888) 304-1133 Fill in appropriate district office
6	If the spill cannot be contained or cleaned-up properly, or if there is a threat of contamination to any bodies of water, immediately contact any of the following applicable emergency response personnel:	
	local fire, police, rescue	911
	National Grid's Rep: (Listed in YOP)	
	Product manufacturer(s)	
	1	1
	2	2
	3	3
	Chemtrec	(800) 424-9300
	additional emergency personnel	
	If there is a doubt as to who should be notified, contact local State Police Barracks: FILL IN	
7	Remain at the scene to provide information and assistance to responding emergency clean-up crews	
8	Refer to the various sources of information relative to handling and clean-up of spilled product	
9	If possible, complete the process of "soaking up" with absorbent materials	
10	Sweep or shovel contaminated products and soil into leak proof containers for proper disposal at approved location	
11	Spread activated charcoal over spill area to inactivate any residual herbicide	

Appendix 9

Environment Policy

Our strategy is to be a recognised leader in the development and operation of safe, reliable and sustainable energy systems to meet the needs of our customers and communities and to generate value for our investors.

One of the ways we will achieve this is to protect and enhance the environment, always seeking new and innovative ways to lighten the environmental impact of our past, present and future activities.

J. Pettigrew

John Pettigrew
Chief Executive

We commit to:

- Ensuring environmental sustainability is considered in our decision making and creating a sustainable thinking culture.
- Using resources more efficiently through good design, using sustainable materials, responsibly refurbishing existing assets, recovery and recycling.
- Ensuring our operations that have an impact on natural habitats are conducted in a manner to protect biodiversity and seeking ways to enhance the natural value of the area for the benefit of local communities and/or environment.
- Reducing greenhouse gas emissions: 45% by 2020 and 80% by 2050.
- Looking at ways to reduce the impact of climate change by implementing mitigation and adaptation measures.
- Openly reporting on our environmental and sustainability performance with employees, members of the public and other stakeholders.
- Actively working to prevent pollution which may result from our activities.
- Continually improving our environmental management system to protect the environment, reduce the risk of environmental incidents.
- Satisfying our compliance obligations.
- Actively managing the risks associated with sites where we have responsibility for dealing with contamination associated with past operations.
- Ensuring our employees have the training, skills, knowledge and resources necessary to meet our environmental commitments.
- Working with governments and regulators to help them develop and deliver more effective environmental policies and targets.
- Helping consumers reduce their dependency on fossil fuels by providing them with access to more sustainable energy and through innovative energy efficiency programmes.
- Ensuring those working on our behalf demonstrate the same commitment to the environment as we do.

For more details on this policy, visit the SSR Infonet homepage of nationalgrid.com

Re: A1/B2 ACR Project Wetland Delineation- Attachment H Supplemental Wetland Information

cc:

The A1/B2 right-of-way (ROW) and tap line ROWs extend approximately 54 miles in Massachusetts. Surveys for wetland resource areas were conducted within the existing transmission line ROW and proposed off ROW access route locations in the towns of Warwick, Royalston, Athol, Winchendon, Gardner, Westminster, Fitchburg, Leominster, and Sterling. Delineations were completed by Vanessa Hangen Brustlin, Inc (VHB) in 2020, and supplemented by BSC Group (BSC) in 2021 and 2022. Field teams used established delineation procedures as outlined in the Massachusetts Department of Environmental Protection's Handbook on Delineating Bordering Vegetated Wetlands (March 1995) ("DEP Handbook") and the United States Army Corps of Engineers (USACE) Wetland Delineation Manual (Environmental Laboratory, January 1987) ("1987 Manual") and the USACE Interim Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Northcentral and Northeast Region (USACE Supplement) (2012).

During the field investigations, VHB and BSC collectively identified and delineated 462 wetland areas, 60 intermittent streams and 68 perennial streams within MA. The existing overhead transmission line ROW contains a variety of wetlands, most of which have been historically affected by the routine vegetation management for the safe operation of the transmission facilities. Wetland communities were identified in accordance with the federal classification system found in Cowardin (1979), and were the following: Palustrine Forested Wetlands, Palustrine Emergent Wetlands, and Palustrine Scrub Shrub Wetlands.

Attachment H Supplemental Wetland Information consists of representative wetland delineation data forms and photographs from BSC and VHB.

Remarks: (If observed, list morphological adaptations below).
No hydrophytic vegetation indicators present; parameter is not met.

WETLAND DETERMINATION DATA FORM - Northcentral and Northeast Region

BSC Wetland WA-W7

G-81-WET

Project Site: A1B2 City/County: Warwick / Franklin Samp. Date: 9/19/2020
Applicant/Owner: National Grid State: MA Sampling Point: G-81-WET
Investigator(s): C. Cyrus, D. Robertson Section, Township, Range:
Landform (hillslope, terrace, etc.): Flat Local relief (concave, convex, none): Concave Slope (%): 1-2%

SUMMARY OF FINDINGS - Attach site map showing sample point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes
Hydric Soil Present? Yes
Wetland Hydrology Present? Yes
Is This Sample Area Within a Wetland? Yes
Remarks: All parameters are met. Area is classified as a palustrine scrub-shrub (PSS) wetland.

HYDROLOGY

Wetland Hydrology Indicators:
Primary Indicators (minimum of one is required; check all that apply)
Secondary Indicators (minimum of two required)
Surface Water (A1) Water-Stained Leaves (B9)
X High Water Table (A2) Aquatic Fauna (B13)
X Saturation (A3) Marl Deposits (B15)
Water Marks (B1) X Hydrogen Sulfide Odor (C1)
Sediment Deposits (B2) Oxidized Rhizospheres on Living Roots (C3)
Drift Deposits (B3) Presence of Reduced Iron (C4)
Algal Mat or Crust (B4) Recent Iron Reduction in Tilled Soils (C5)
Iron Deposits (B5) Thin Muck Surface (C7)
X Inundation Visible on Aerial (B7) Other (Explain in Remarks)
Sparsely Vegetated Concave Surface (B8) FAC-Neutral Test (D5)
Field Observations:
Surface Water Present? Depth (inches): N/A
Water Table Present? X Depth (inches): Surface
Saturation Present? X Depth (inches): Surface
Wetland Hydrology Present? Yes
Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:
Remarks: At least one primary or two secondary indicators of wetland hydrology present; parameter is met.

SOIL

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Remarks: (If observed, list morphological adaptations below).
No hydrophytic vegetation indicators present; parameter is not met.

WETLAND DETERMINATION DATA FORM - Northcentral and Northeast Region

G-84-WET

Project Site: A1B2 City/County: Warwick / Franklin Samp. Date: 9/19/2020
 Applicant/Owner: National Grid State: MA Sampling Point: G-84-WET
 Investigator(s): C. Cyrus, D. Robertson Section, Township, Range: _____
 Landform (hillslope, terrace, etc.): Flat Local relief (concave, convex, none): Concave Slope (%): 1-2%
 Subregion (LRR or MLRA): LRR R Lat: 42.71911 Long: -72.37839 Datum: WGS 1984
 Soil Map Unit: Scituate fine sandy loam, 3 to 8 percent slopes, very stony NWI Class: PEM
 Are climatic/hydrologic conditions on the site typical for this time of year? No Remarks: Drought conditions
 Are Normal Circumstances present? No If needed, explain any answers in Remarks: Drought conditions
 Are Vegetation Yes, Soil No, or Hydrology No significantly disturbed? Remarks: Powerline easement
 Are Vegetation No, Soil No, or Hydrology No naturally problematic? Remarks: _____

SUMMARY OF FINDINGS - Attach site map showing sample point locations, transects, important features, etc.

Hydrophytic Vegetation Present? <u>Yes</u>	Is This Sample Area Within a Wetland? <u>Yes</u>
Hydric Soil Present? <u>Yes</u>	
Wetland Hydrology Present? <u>Yes</u>	
Remarks: All parameters are met. Area is classified as a palustrine scrub-shrub (PSS) wetland.

WETLAND DETERMINATION DATA FORM - Northcentral and Northeast Region

A44 wet

Project Site: A1B2 City/County: Warwick / Franklin Samp. Date: 8/18/2020
Applicant/Owner: National Grid State: MA Sampling Point: A44 wet
Investigator(s): K. Kinsella and E. Martin Section, Township, Range: Warwick
Landform (hillslope, terrace, etc.): Depression Local relief (concave, convex, none): Concave Slope (%): 3-5%
Subregion (LRR or MLRA): LRR Lat: 42.70794 Long: -72.34006 Datum: GCS WGS 1984
Soil Map Unit: Walpole sandy loam NWI Class: PEM
Are climatic/hydrologic conditions on the site typical for this time of year? Yes
Are Normal Circumstances present? Yes If needed, explain any answers in Remarks:
Are Vegetation Yes, Soil No, or Hydrology No significantly disturbed? Remarks: Maintained utility ROW
Are Vegetation No, Soil No, or Hydrology No naturally problematic? Remarks:

SUMMARY OF FINDINGS - Attach site map showing sample point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes
Hydric Soil Present? Yes
Wetland Hydrology Present? Yes
Is This Sample Area Within a Wetland? Yes
Remarks:

HYDROLOGY

Wetland Hydrology Indicators:
Primary Indicators (minimum of one is required; check all that apply)
Secondary Indicators (minimum of two required)
Surface Water (A1) Water-Stained Leaves (B9)
High Water Table (A2) Aquatic Fauna (B13)
X Saturation (A3) Marl Deposits (B15)
Water Marks (B1) Hydrogen Sulfide Odor (C1)
Sediment Deposits (B2) Oxidized Rhizospheres on Living Roots (C3)
Drift Deposits (B3) Presence of Reduced Iron (C4)
Algal Mat or Crust (B4) Recent Iron Reduction in Tilled Soils (C5)
Iron Deposits (B5) Thin Muck Surface (C7)
Inundation Visible on Aerial (B7) Other (Explain in Remarks)
Sparsely Vegetated Concave Surface (B8)
Field Observations:
Surface Water Present? Depth (inches): N/A
Water Table Present? Depth (inches): N/A
Saturation Present? X Depth (inches): 5
Wetland Hydrology Present? Yes
Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:
Remarks:

WETLAND DETERMINATION DATA FORM - Northcentral and Northeast Region

G-55-UPL

Project Site: A1B2 City/County: Royalston / Worcester Samp. Date: 9/14/2020
Applicant/Owner: National Grid State: MA Sampling Point: G-55-UPL
Investigator(s): C. Cyrus, D. Robertson Section, Township, Range:
Landform (hillslope, terrace, etc.): Hillside Local relief (concave, convex, none): Undulating Slope (%): 3-5%
Subregion (LRR or MLRA): LRR R Lat: 42.69736 Long: -72.27532 Datum: WGS 1984
Soil Map Unit: Becket-Skerry association, 0 to 15 percent slopes, extremely stony NWI Class: Upland
Are climatic/hydrologic conditions on the site typical for this time of year? No Remarks: Drought condition
Are Normal Circumstances present? No If needed, explain any answers in Remarks: Drought conditions
Are Vegetation Yes, Soil No, or Hydrology No significantly disturbed? Remarks: Powerline ROW
Are Vegetation No, Soil No, or Hydrology No naturally problematic? Remarks:

SUMMARY OF FINDINGS - Attach site map showing sample point locations, transects, important features, etc.

Hydrophytic Vegetation Present? No
Hydric Soil Present? No
Wetland Hydrology Present? No
Is This Sample Area Within a Wetland? No
Remarks: One or more parameters lacking. Area is not a jurisdictional wetland.

HYDROLOGY

Wetland Hydrology Indicators:
Primary Indicators (minimum of one is required; check all that apply)
Secondary Indicators (minimum of two required)
Surface Water (A1) Water-Stained Leaves (B9) Surface Soil Cracks (B6)
High Water Table (A2) Aquatic Fauna (B13) Drainage Patterns (B10)
Saturation (A3) Marl Deposits (B15) Moss Trim Lines (B16)
Water Marks (B1) Hydrogen Sulfide Odor (C1) Dry-Season Water Table (C2)
Sediment Deposits (B2) Oxidized Rhizospheres on Living Roots (C3) Crayfish Burrows (C8)
Drift Deposits (B3) Presence of Reduced Iron (C4) Saturation Visible on Aerial (C9)
Algal Mat or Crust (B4) Recent Iron Reduction in Tilled Soils (C5) Stunted or Stressed Plants (D1)
Iron Deposits (B5) Thin Muck Surface (C7) Geomorphic Position (D2)
Inundation Visible on Aerial (B7) Other (Explain in Remarks) Shallow Aquitard (D3)
Sparsely Vegetated Concave Surface (B8) FAC-Neutral Test (D5)
Field Observations:
Surface Water Present? Depth (inches): N/A Wetland Hydrology Present? No
Water Table Present? Depth (inches): N/A
Saturation Present? Depth (inches): N/A
Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:
Remarks: No primary or secondary indicators of wetland hydrology present; parameter is not met.

WETLAND DETERMINATION DATA FORM - Northcentral and Northeast Region

BSC Wetland RO-W6

G-91-UPL

Project Site: A1B2 City/County: Royalston / Worcester Samp. Date: 9/22/2020
Applicant/Owner: National Grid State: MA Sampling Point: G-91-UPL
Investigator(s): C. Cyrus, D. Robertson Section, Township, Range: N/A
Landform (hillslope, terrace, etc.): Terrace Local relief (concave, convex, none): Undulating Slope (%): 3-5%
Subregion (LRR or MLRA): LRR R Lat: 42.69547 Long: -72.26321 Datum: WGS 1984
Soil Map Unit: Bucksport and Wonsqueak mucks, 0 to 2 percent slopes NWI Class: PSS
Are climatic/hydrologic conditions on the site typical for this time of year? No Remarks: Drought conditions
Are Normal Circumstances present? No If needed, explain any answers in Remarks: Drought conditions
Are Vegetation Yes, Soil No, or Hydrology No significantly disturbed? Remarks: Powerline ROW
Are Vegetation No, Soil No, or Hydrology No naturally problematic? Remarks:

SUMMARY OF FINDINGS - Attach site map showing sample point locations, transects, important features, etc.

Hydrophytic Vegetation Present? No
Hydric Soil Present? No
Wetland Hydrology Present? No
Is This Sample Area Within a Wetland? No
Remarks: One or more parameters lacking. Area is not a jurisdictional wetland.

HYDROLOGY

Wetland Hydrology Indicators:
Primary Indicators (minimum of one is required; check all that apply)
Secondary Indicators (minimum of two required)
Surface Water (A1) Water-Stained Leaves (B9) Surface Soil Cracks (B6)
High Water Table (A2) Aquatic Fauna (B13) Drainage Patterns (B10)
Saturation (A3) Marl Deposits (B15) Moss Trim Lines (B16)
Water Marks (B1) Hydrogen Sulfide Odor (C1) Dry-Season Water Table (C2)
Sediment Deposits (B2) Oxidized Rhizospheres on Living Roots (C3) Crayfish Burrows (C8)
Drift Deposits (B3) Presence of Reduced Iron (C4) Saturation Visible on Aerial (C9)
Algal Mat or Crust (B4) Recent Iron Reduction in Tilled Soils (C5) Stunted or Stressed Plants (D1)
Iron Deposits (B5) Thin Muck Surface (C7) Geomorphic Position (D2)
Inundation Visible on Aerial (B7) Other (Explain in Remarks) Shallow Aquitard (D3)
Sparsely Vegetated Concave Surface (B8) FAC-Neutral Test (D5)
Field Observations:
Surface Water Present? Depth (inches): N/A Wetland Hydrology Present? No
Water Table Present? Depth (inches): N/A
Saturation Present? Depth (inches): N/A
Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:
Remarks: No primary or secondary indicators of wetland hydrology present; parameter is not met.

SOIL

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

WETLAND DETERMINATION DATA FORM - Northcentral and Northeast Region

G-88-UPL

Project Site: A1B2 City/County: Royalston / Worcester Samp. Date: 9/21/2020
 Applicant/Owner: National Grid State: MA Sampling Point: G-88-UPL
 Investigator(s): C. Cyrus, D. Robertson Section, Township, Range: _____
 Landform (hillslope, terrace, etc.): Hillside Local relief (concave, convex, none): Undulating Slope (%): 5-8%
 Subregion (LRR or MLRA): LRR R Lat: 42.69477 Long: -72.25868 Datum: WGS 1984
 Soil Map Unit: Becket-Skerry association, 0 to 15 percent slopes, extremely stony NWI Class: Upland
 Are climatic/hydrologic conditions on the site typical for this time of year? No Remarks: Drought conditions
 Are Normal Circumstances present? No If needed, explain any answers in Remarks: Drought conditinos
 Are Vegetation Yes, Soil No, or Hydrology No significantly disturbed? Remarks: Powerline easement
 Are Vegetation No, Soil No, or Hydrology No naturally problematic? Remarks: _____

SUMMARY OF FINDINGS - Attach site map showing sample point locations, transects, important features, etc.

Hydrophytic Vegetation Present? <u>Yes</u>	Is This Sample Area Within a Wetland? <u>No</u>
Hydric Soil Present? <u>No</u>	
Wetland Hydrology Present? <u>No</u>	

Remarks: One or more parameters lacking. Area is not a jurisdictional wetland.
